Frons broadly plano-convex from epistoma to well above eyes, lateral margins subangulate, separated from eye by distance equal to three times diameter of a facet; surface smooth, shining, punctures very fine, moderately close, uniformly distributed except absent on small median area above epistoma; vestiture of fine, moderately abundant hair, rather short in central area, moderately long at margins, longest setae equal in length to about one-third distance between eyes.

Pronotum 1.0 times as long as wide; about as in ciliatus except anterior margin more narrowly rounded, armed by 12 low serrations.

Fig. 206. Pityophthorus spp.: 20-21, balsameus (=patchi), dorsal aspect and head of female; 22-23, dentifrons, dorsal aspect and head of male: 24, intextus, dorsal aspect of male. (After Blackman 1922:136.)

Elytra 1.6 times as long as wide, 1.7 times as long as pronotum; outline about as in ciliatus; striae not impressed except 1 narrowly almost to base, punctures in rows to base, fine, spaced by one to two diameters of a puncture; interstriae almost smooth, with a few fine, transverse lines, almost three times as wide as striae, odd-numbered interstriae with a few punctures. Declivity steep, moderately sulcate; striae 1 and 2 obsolete, a few punctures often visible near apex; interstriae 1 abruptly, rather narrowly, moderately elevated, armed by a row of about 10 fine tubercles, 2 two and one-half times as wide as l, rather strongly, broadly sulcate, surface smooth and shining, minute, impressed points abundant, impunctate, 3 as high as 1 , rather broadly rounded, armed by a row of about seven moderately coarse tubercles, a small tubercle usually present at junction of 5 and 7. Vestiture of minute strial hair (usually abraded), and on and near declivity rows of hair on odd-numbered interstriae, longest setae equal in length to width of an interstriae.

Male. - Similar to female except frons abruptly, rather strongly impressed from epistoma to upper level of eyes, impression divided by an acutely elevated median carina, subdentate near its lower end, surface rather coarsely punctured, vestiture short, inconspicuous.

Distribution.- Alberta and Nova Scotia to North Carolina.

CANADA: Alberta: Cypress Hills. New Brunswick: Portage Vale. Nova Scotia: Halifax. Ontario: Dryden. Quebec: Gaspé Co. Prince Edward Island: Dalway. USA: Maine: Camp Caribou, Orono, Peak 1sland. Maryland: Plummers Island. Minnesota: Cass Lake. New Hampshire: Littleton, Mt. Washington. New York: Cranberry Lake. North Carolina: Black Mountains, Pisgah Ridge. West Virginia: Davis, Randolph Co., Spruce Mt.

Ноst.-Picea glauca, P. rubra.
Biology.- Specimens were taken from seedlings and small branches.

Notes.- The above treatment was based on the holotype and on 188 other specimens.

## 94. Pityophthorus setosus Blackman

[^21]Diagnosis.- This unique species is distinguished by the tuft of hair on the lower declivity of the female and by other declivital characters.

Female.- Length $1.8-2.0 \mathrm{~mm}, 2.8$ times as long as wide; color brown, elytra slightly lighter.

Frons broadly convex, shining and rather finely, closely, uniformly punctured to slightly above eyes, lateral margins rounded; vestiture rather abundant, uniformly distributed, moderately long, longest setae above, their length equal to half distance between eyes.

Pronotum 1.08 times as long as wide; outline basically as in dentifrons Blackman except summit distinctly in front of middle; posterior areas smooth, shining, punctures rather coarse, close, shallow. Vestiture short, semirecumbent.

Elytra 1.8 times as long as wide, 1.8 times as long as pronotum; sides almost straight and parallel on basal three-fourths, rather broadly rounded behind; striae not impressed except 1 narrowly on posterior third of disc, punctures moderately coarse, deep; interstriae smooth, shining, as wide as striae, 2 and 4 impunctate, odd-numbered interstriae usually sparsely punctured at least on posterior half. Declivity steep, moderately sulcate; striae 1 and 2 obsolete or punctures replaced by fine granules; interstriae 1 moderately elevated, armed by a row of closely spaced fine granules, 2 twice as wide as 1 , moderately sulcate, smooth, shining, with numerous, minute, impressed points, 3 as high as 1,3 and summit of lateral areas armed by numerous (about 30) confused, fine granules, each bearing a conspicuous, long, yellow hair (usually appearing on lower third as a tuft). Vestiture confined to sides and declivity.

Male.- Similar to female except frons abruptly, rather shallowly impressed below upper level of eyes, surface of impressed area more coarsely punctured and armed by an acutely elevated median carina, almost subdentate on its lower half; serrations on anterior margin of pronotum distinctly larger; declivital setae short, inconspicuous.

Distribution.- California.
USA: California: Carmel, Del Monte, Inverness, Monterey, Pacific Grove, Pt. Reyes, San Francisco, Sharp Peak and Tunitas in San Mateo Co.

Hosts.- Pinus radiata, one series from $P$. muricata.

Notes.- The above treatment was based on the holotype and on 149 other specimens.

## 95. Pityophthorus biovalis Blackman

Pityophthorus biovalis Blackman, 1922, New York St. Coll. For., Syracuse, Tech. Pub. 16:122 (Holotype, female; Brunswick, Maine; U.S. Nat. Mus., 56916)

Diagnosis.- This species is distinguished by the female frons, described below, and by the rather normal declivity.

Female.- Length $1.7-2.0 \mathrm{~mm}, 3.1$ times as long as wide; color dark brown.

Frons rather strongly biconcave, concavity on each half extending from epistoma to slightly above upper level of eyes, its surface smooth, brightly shining, dorsal and lateral margins with a fringe of long hair, median line subacutely elevated (but its crest sometimes longitudinally concave) and ornamented by a few short setae; spongy areas entirely absent; longest setae equal to about one-third distance between eyes.

Pronotum 1.2 times as long as wide; widest near base, sides straight on basal half, converging very slightly, constriction not evident, rather broadly rounded in front; anterior margin armed by about 10 low serrations; summit slightly in front of middle, with a distinct posterior impression; posterior areas smooth, shining, obscurely subreticulate, punctures rather fine, spaced on disc by two to three diameters of a puncture. Disc glabrous, short, sparse hair in lateral areas.

Elytra 1.9 times as long as wide, 1.6 times as long as pronotum; sides almost straight and parallel on basal three-fourths, then converging slightly, very broadly rounded behind; striae 1 slightly, others not impressed, punctures rather coarse, close, deep; interstriae twice as wide as striae, almost smooth, punctures similar to those of striae, rather sparse on all interstriae. Declivity very steep, rather shallowly sulcate; striae 1 and 2 obsolete except a few minute punctures near apex; interstriae 1 distinctly elevated, unarmed, 2 almost three times as wide as 1 , moderately impressed on median half, ascending laterally, with some impressed points, 3 distinctly higher than 1 , its summit
armed near middle by three conspicuous tubercles, two or three much smaller granules usually above or below major tubercles. Vestiture usually absent on disc, minute strial and short interstrial rows of hair present on declivity and sides except declivital interstriae glabrous.

Male--Similar to female except lower two-thirds of frons moderately, transversely impressed, with an acute median carina on impressed area, surface smooth, shining, coarsely, closely punctured, vestiture short, inconspicuous; pronotal dise more strongly reticulate; lateral summits on elytral declivity more subacutely elevated.

Distribution.- Ontario to Maine and New York.

CANADA: Ontario: Huron, 9-VIII-63, R. Bowser; Kakabeca Falls, 27-V-64. Pinus strobus; Waskesin, 26-VIII-53. Picea glauca. USA: Maine: Brunswick, 29-VI-I9, Picea rubens, M. W. Blackman; Orono, 19-VIII-I9, M. W. Blackman; Peak Island, Hopk. U.S. 406, P. rubens, A. D. Hopkins. New York: Adirondacks, 20-XII-I6, Pinus strobus, E. P. Felt.

Hosts.-Picea glauca, P. rubens, Pinus strobus.

Biology.- Specimens were taken from twigs.

Notes.- The above treatment was based on the holotype and on eight other specimens.

## 96. Pityophthorus cavatus Bright

Pityophthorus caratus Bright. 1978, Great Bavin Nat. 38:74 (Holotype, female; Canoe Lake, Saskatchewan, Canada; Canadian Nat. Coll., 15492)
Diagnosis.- This species differs from biovalis Blackman by characters of the female frons as described below.

Female.- Length $1.8-2.1 \mathrm{~mm}, 3.1$ times as long as wide; color very dark brown.

Frons concavely impressed (variable), much as in biovalis except median partition entirely absent; margins fringed by setae as in biovalis specimens, with reduced concave area sometimes with a profusion of hair, others almost glabrous.

Pronotum, elytra, and male as in biovalis.
Distribution.-Saskatchewan Manitoba.

CANADA: Manitoba: Charlottetown, I3-VIII-54. Pinus resinosa. Saskatchewan: Canoe Lake, 21-VII-72. Pinus banksiana, D. E. Bright.

Notes.- The above treatment was based on the type series of 12 specimens.

## 97. Pityophthorus concavus Blackman

Pityophthorus concavus Blackman, 1928, New York St. Coll. For., Syraeuse, Tech. Pub. 25:85 (Holotype, female; Seney, Michigan, U.S. Nat. Mus., 41297)
Pityophthorus hesperius Bright, 1978. Great Basin Nat. 38:76 (Holotype, female; Hudson Hope, British Columbia; Canadian Nat. Coll. I549I). Possible synonym or subspecies
Diagnosis.- This species is distinguished from biovalis Blackman by characters of the female frons and male declivity as described below.

Female. - Length $1.8-2.0 \mathrm{~mm}, 3.0$ times as long as wide; color dark brown.

Frons variable; shallowly concave on median half to very strongly concave on median three-fourths; lateral areas of concavity and crest spongy, median area smooth, shining, with abundant minute punctures (or impressed points?); vestiture not evident except for spongy texture.

Pronotum and elytral disc as in biovalis except punctures slightly finer, not as deep. Elytral declivity as in biovalis except tubercles on lateral convexities much finer.

Male.-Similar to female except frons as in male biocalis; elytral declivity devoid of granules, lateral convexities at middle displaced mesad, forming a submammiform enlargement on lateral two-thirds of space normally occupied by interstriae 3, this enlargement very narrowly separated from interstriae 1 (in allotype elevation extending mesad almost to suture).

Distribution. - (British Columbia?) Ontario and Wisconsin to New Brunswick and Maine.
CANADA: New Brunswick: Fredricton, 13-VIII-35, L. J. Simpson: one female bears Swaine's field number 2497 (origin?). Ontario: Ottawa, 10-Vill-72, Picea glauca. A. Davies. Quebec: Kazabazua, 24-VIII-66, Pinus banksiana, D. E. Bright. USA: Maine: Peak Island, Hopk. U.S. 406a, Picea; Topsfield, 4-V1II-70, Ficca, D. E. Bright. Michigan: Seney, Pinus resinosa, W. F. Fiske. Wisconsin: Boulder Junction; Vilas Co., 19-VII-55, P. resinosa, R. D. Shenefelt.

Hosts.- Pinus banksiana, P. resinosa, Picea glauca.

Notes.- The above treatment was based on the holotype and allotype and on 42 other specimens.

The extreme variability of the female frons in cariniceps LeConte suggests similar variability in the biovalis-balsameus complex. Much more material, particularly long series, are needed before a meaningful evaluation of these species can be made.

Two series from British Columbia ( 13 specimens from Hudson Hope, 21-VIII-74 to 6-IX-74, 14-XI-72, Pinus contorta, and one specimen from Hixon, 9-VIII-72, Pinus contorta, D. E. Bright) look like concavus but are darker and the female frons is more polished in the lateral areas. Bright (1978:76) designated these specimens as hesperius Bright. More material from other localities must be studied before the status of his name can be determined.

## 98. Pityophthorus briscoei Blackman

Pityophthorus briscoci Blackman, 1922, New York St. Coll. For., Syracuse, Tech. Pub. 16:123 (Holotype, female; Brunswick, Maine; U.S. Nat. Mus., 56915)

Pityophthorus mundus Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:86 (Holotype, female; Littleton, New Hampshire; U.S. Nat. Mus.); Wood, 1977, Great Basin Nat. 37:5I4. Synonymy
Diagnosis.- This species is distinguished from biovalis Blackman by characters of the female frons as indicated below.

Female.- Length $1.6-1.9 \mathrm{~mm}, 3.0$ times as long as wide; color dark brown.

Frons variable; basically weakly convex to flattened, area from epistoma to upper level of eyes somewhat irregularly, transversely impressed, oval areas on lateral thirds dull, spongy to finely pilose (spongy areas flat to strongly protuberant, occasionally meeting on median line), remaining areas smooth, shining, with upper areas rather coarsely punctured, median third (between spongy areas) moderately to deeply sulcate, a pair of small tubercles sometimes mark margins of sulcus at either dorsal or ventral end or both; glabrous except for texture of spongy areas.

Pronotum and elytra as in biovalis except granules on lateral margins of elytral declivity very fine.

Male.- Similar to male biovalis except carina on frons greatly reduced, conspicuous only at ventral, subtuberculate end; declivity devoid of granules.

Distribution.- Ontario and Minnesota to New Brunswick and Pennsylvania.

CANADA: New Brunswick: Riley Brook, 6-VII-70, Pinus strobus, D. E. Bright. Ontario: Manitouwadge, 26-V-64, Pinus banksiana. USA: Maine: Brunswick, 29-V129, M. W. Blackman. Minnesota: Cloquet, 8-IX-36, Norway pine. H. R. Dodge. New Hampshire: Crawford Notch, 7-VIII-70, Picea, D. E. Bright; Littleton, 2-VI-22. New York: Cranberry Lake, 5-VII-23, M. W. Blackman. Pennsylvania: Mildred 14-VII-32, Picea mariana, J. N. Knull; Sulivan Co., 10-VIII, J. N. Knull; Ricketts, 31-VII3I, J. N. Knull.

Host.- "Norway pine," Picea rubens, Pinus banksiana, P. strobus.

Notes.- The above treatment was based on the holotypes of briscoei and mundus and on 145 other specimens.

## 99. Pityophthorus balsameus Blackman Fig. 206

Pityophthorus balsameus Blackman, 1922, New York St. Coll. For., Syracuse, Tech. Pub. 16:199 (Holotype, female; Orono, Maine; U.S. Nat. Mus.)
Pityophthorus patchi Blackman, 1922, New York St. Coll. For., Syracuse, Tech. Pub. 16:120 (Holotype, female; Orono, Maine; U.S. Nat. Mus.) Wood, 1977, Great Basin Nat. 37:514. Synonymy
Diagnosis.- This species is distinguished from mundus Blackman by the female frons described below and by the male declivity.

Female.- Length 1.6-1.8 mm, 3.0 times as long as wide; color dark brown.

Frons variable; basically broadly convex, area below upper level of eyes weakly impressed on lateral fourths, occasionally with a feeble impression in central area; a conspicuous median tubercle or summit on epistoma; median half to three-fourths spongy, usually extending from epistoma to upper level of eyes (variable).

Pronotum and elytra as in biovalis Blackman.

Male--Similar to male concavus except enlarged protuberances on declivity more strongly displaced toward suture.

Distribution.- Michigan and Nova Scotia to North Carolina.

CANADA: New Brunswick: Bass River Road, Jemseg, Portage Vale. Nova Scotia: Halifax. USA: Maine: Chemo Lake, Eastmont, Orono. Michigan: Gibb City, Shingleton. New Hampshire: Crawford Notch. New York: Cranberry Lake. North Carolina: Tryon. West Virginia: Cranesville, Morgantown.

Hosts.-Abies balsamea, Picea glanca, P. sp., Pinus banksiana, P. resinosa, P. strobus.

Biology.- Specimens were taken from twigs.

Notes.- The above treatment was based on the holotypes of balsameus and patchi and on 108 other specimens.

The form represented by this species appears to represent the basic structure from which all others in the biovalis-balsameus complex were derived. It is very doubtful that all represent valid species. It is not improbable that only one genetically unstable species is represented that is comparable to cariniceps LeConte.

## 100. Pityophthorus angustus Blackman

Pityophthorus angustus Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:83 (Holotype. female; Cranberry Lake, New York; U.S. Nat. Mus.)
Diagnosis.- This species is distinguished from balsameus Blackman by the female frons described below and by the male declivity.

Female.- Length $2.0-2.1 \mathrm{~mm}, 2.9$ times as long as wide; color dark brown.

Frons moderately, biconcavely impressed from epistoma to upper level of eyes, with an obtusely compressed, moderately elevated median partition, its ventral end forming an almost beaklike process above epistoma (variable); median half spongy; vestiture absent.

Pronotum and elytra as in biovalis Blackman.

Male.-Similar to male biovalis except declivity with processes comparable to concavus Blackman except more extensive (longitudinally) and displaced across interstriae 1 to suture, almost touching one another.

Distribution.- Ontario and Nova Scotia to North Carolina.

CANADA: New Brunswick: Bass River. 12-V111-66, Pinus strobus. Nova Scotia: Halifax, No. 22. Ontario: Huron, 9-VIIl-63, R. Bowser. USA: New York: Adirondacks, 20-XII-16, Pinus strobus, E. P. Felt; Cranberry Lake, 5-17-VII-23, Picea rubens, Abies balsamea, M. W. Blackman. North Carolina: Black Mountains, 18-V; Tryon, Hopk. 3154.

Hosts.- Picea rubens, Abies balsamea, Pinus strobus.

Notes.- The above treatment was based on the holotype and on 53 other specimens.

## 101. Pityophthorus carinatus carinatus Bright

Pityophthorus carinatus Bright, 1978, Great Basin Nat. 38:73 (Holotype, female; Sevey, New York; Canadian Nat. Coll., 15489)

Diagnosis.- This species is distinguished from angustus Blackman by the sculpture of the female frons as described below.

Female.- Length 1.8-2.0 mm, 2.9 times as long as wide; color very dark brown.

Frons somewhat similar to angustus except median partition very strongly, acutely elevated, partition very thin; lateral concavities deeply, rather extensively impressed; median partition partly or entirely spongy, glabrous.

Pronotum and elytra as in angustus.
Male.- As in male angustus.
Distribution.- New Brunswick to New York.

CANADA: New Brunswick: 3 km or 2 miles E Wemsea, Queen's Co., 21-V1-65, Pinus strobus branch, F.1.S. 64-1340-01. USA: New York: Sevey, 8-V1II-70, Picea, D. E. Bright.

Notes.- The above treatment was based on the type series of five specimens.

## 102. Pityophthorus carinatus monticolae Bright

Pityophthorus carinatus monticolae Bright, 1978, Great Basin Nat. 38:74 (Holotype, female; Hazelton, British Columbia; Canadian Nat. Coll., 15490)
Diagnosis.- This form is distinguished from carinatus carinatus Bright by characters of the female frons as described below.

Female.- Length $1.9-2.1 \mathrm{~mm}, 2.9$ times as long as wide; color very dark brown.

Frons as in c. carinatus except median partition twice as thick, its crest pubescent.

Male.- As in male c. carinatus.
Distribution.- British Columbia to Alberta.

CANADA: Alberta: Edmonton, 5-V1I-24, F. S. Carr (four of these lack the name of the collector and have the additional label, A. T. McClay Collection). British Columbia: Hazelton, 11-VI-70, Pinus contorta, F.I.S. $70-$ 569-01.

Notes.- The above treatment was based on 11 specimens, including the type series.

## 103. Pityophthorus cariniceps LeConte

Pityophthorus cariniceps LeConte, 1876, Proc. Amer. Philos. Soc. 15:353 (Holotype, female; Detroit, Michigan; Mus. Comp. Zool.)
Pityophthorus canadensis Swaine, 1917, Dom. Canada Dept. Agric. Ent. Br. Tech. Bull. 14(1):24 (Lectotype, female; Ste. Anne de Bellevue, Quebec; Canadian Nat. Coll., 9319, designated by Bright, 1967, Canadian Ent. 99:678); Blackman, 1928, New York St. Coll., For., Syracuse, Tech. Pub. 25:72. Synonymy

Pityophthorus cognatus Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:69 (Holotype, female; Davidson's R., North Carolina: U.S. Nat. Mus., 41286), Wood, 1977. Great Basin Nat. 37:514. Synonymy. Subspecies?
Diagnosis.- This species is distinguished from the biovalis-balsameus complex of species by the larger size, by the more confused, more coarsely punctured elytra, and by other characters.

Female.- Length 2.1-2.5 mm, 2.8 times as long as wide; color dark reddish brown.

Frons variable; from broadly, weakly convex, with a slight median impression or moderate protuberance on median half to rather strongly biconcave from epistoma to upper level of eyes, with a laterally compressed, strongly elevated median elevation, with or without a median tubercle in any of these variations; part or most of surface spongy or not; pubescence from minute velvet pile to short abundant hair.

Pronotum 1.05 times as long as wide; basically as in biovalis except punctures in posterior areas coarser, closer.

Elytra 1.6 times as long as wide, 1.6 times as long as pronotum; outline and sculpture about as in biovalis except discal punctures coarser, slightly confused, sulcus slightly deeper, narrower, tubercles on lateral convexities larger.

Male.-Similar to female except frons about as in biovalis; declivity as in concavus male except processes at middle more strongly projecting, almost attaining suture in some specimens (variable).

Distribution.- Manitoba and Nova Scotia to Kentucky and North Carolina.

CANADA: Alberta?: Edmonton (1 male). Manitoba: Whiteshell Prov. Pk. New Brunswick: Berwick, Fredricton, Jemseg, McGraw Brook, Oak Bay. Nova Scotia: Kejimkujik N.P., Kingston, Welmot. Ontario: Beardmore. Bourget. Carp, Cedar Bay, Geralton, Kakabeka Falls, Longlac, Nestor Falls, Ottawa, Parry Somnd, Toronto, Wabigoon. Quebec: Ile Perrot, Old Chelsea, Quebec, Ste. Amne's, St. Hilaire. Saskatchewan: Meadow Lake Prov. Pk. USA: Kentucky: Hazard. Maine: Orono. Massachusetts: Southboro. Michigan: Charlevoix Co., Detroit, Grand Island, Munising. Minnesota: Cloquet, Crow Wing Co., Washington Co. New Hampshire: Crawford Notch, Deerfield. New York: Bear Mountains, Cranherry Lake, Ithaca, Syracuse. North Carolina: Asheville, Tryon. Ohio: Hocking Co. Pennsylvania: Milford. Wisconsin: "Wisconsin."

Hosts.- Abies balsamea, Picea glauca, Pinus banksiana, P. resinosa, P. strobus.

Biology.- Specimens were taken from twigs and small branches.

Notes.- The above treatment was based on the holotypes of cariniceps, cognatus, and vibrissus on the lectotype of canadensis, and on 1103 other specimens.

The variability of the female frons and the male elytral declivity in this species is unusually great. The female frons, in a series from North Carolina (type series of cognatus), is plano-convex to well above the upper level of the eyes, with the surface somewhat coarsely, closely punctured and bearing uniformly distributed, fine, rather long hair (longest equal in length to one-fourth distance between eyes). Females in series from Marian, North Carolina, Kentucky, Virginia, and northward usually contain a mixture of extreme and intermediate variants between (1) those with the contours as described above for the female and very minutely punctured and either glabrous or with dense, minute pile on this punctured area, or (2) those with the punctured area protuberant, the lateral areas variously impressed or not, sometimes so extensively impressed that only a strong carinalike median partition remains, the surface is minutely punctured and glabrous or with minute pile.

The male declivity, in specimens from North Carolina, is much as in crassus Blackman, with the sulcus narrower and appearing deeper ( 30 percent of elytral width or less; 40 percent or more in crassus). Males in the southern half of the remaining distribution (excluding North Carolina) tend to have the declivity as in the North Carolina material, except, as the point of geographical origin moves northward, the crest tends to peak or come to a summit at or just below the middle; the crest of this peak bears tubercles. Exclusively in the northern half of the range and less commonly southward to Virginia, the declivital peak loses the tubercles and becomes displaced and turned toward the suture as a blunt horn, often almost touching at the suture.

Series from localities north of Virginia may contain most of the variations described above for both sexes. The only possible division for a geographical race appears to be based on the female frons of the North Carolina population (cognatus), but more material
should be studied before formal recognition is given.

## 104. Pityophthorus confinis LeConte Fig. 201

Pityophthorus confinis LeConte, 1876, Proc. Amer. Philos. Soc. 15:354 (Lectotype, female; Mojave region, California; Mus. Comp. Zool., designated by Bright, 1976, Coleopt. Bull. 30:185)
Diagnosis.- This species is distinguished by the rather large size and stout body, by the coarse, deep, strongly confused punctures of the elytral disc, and by characters of the frons and declivity described below.

Female.- Length $2.2-2.9 \mathrm{~mm}, 2.4$ times as long as wide; color dark brown to dark reddish brown.

Frons shallowly, transversely impressed (almost flat on median half) from epistoma to upper level of eyes, rounded at lateral margins; surface shining, rather finely, closely, uniformly punctured on impressed area, more coarsely punctured at lateral and dorsal margins; vestiture moderately abundant and of uniform distribution and length on impressed area, not extending above upper level of eyes, longest setae equal to one-third distance between eyes.

Pronotum 1.0 times as long as wide; widest near base, sides on basal half moderately arcuate, converging anteriorly to slight constriction just before rather narrowly rounded anterior margin; anterior margin armed by about eight low serrations; summit at middle, with a distinct transverse, posterior impression; posterior areas smooth, shining, with numerous impressed points (sometimes obscure), punctures rather coarse, deep, moderately close. Glabrous except at margins and on asperate area.

Elytra 1.5 times as long as wide, 1.6 times as long as pronotum; sides almost straight and parallel on basal two-thirds then converging slightly, very broadly rounded behind; disc smooth, shining, striae discernable on some specimens, punctures coarse, deep, strongly confused. Declivity very steep, broadly, rather strongly sulcate; striae 1 obsolete, 2 with a row of minute punctures completely or incompletely present; interstriae 1 rather narrow, distinctly elevated, armed by a row of fine tubercles, 2 at middle three times as wide as 1 , somewhat narrower above and
below, rather strongly, broadly sulcate, surface smooth, shining, with minute impressed points, 3 slightly higher than 1, armed by a row of about four to eight fine tubercles. Disc glabrous; sides and lateral convexities of declivity with sparse, short hair.

Male.- Similar to female except frons rather strongly convex, coarsely punctured, armed just below upper level of eyes by a conspicuous, short, blunt, median carina, feeble extensions of carina may extend longitudinally or laterally, vestiture short, inconspicuous; serrations on anterior margin of pronotum larger.

Distribution.- British Columbia and Montana to California and New Mexico.

CANADA: British Columbia: Aspen Grove, Clinton, Copper Mt., Grand Forks, Merritt, Nicola. USA: Arizona: Alpine in Apache Co., Carr Canyon in Huachuca Mts.. Chiricahua Mts., Flagstaff, Kaibab N.F., Prescott. Pinaleno Mts.. Santa Rita Mts.. Santa Catalina Mts. Williams. Walker. California: El Dorado. Fresno, Lake. Lassen, Los Angeles, Madera, Mariposa, Modoc, Mono, Plumas, Riverside. San Bernardino. San Diego, Shasta, Sonoma, Siskiyou, Tulare, Toulumne, and Ventura counties. Colorado: Ft. Garland, Veta Pass. Idaho: Centerville, Coeur d'Alene, Moscow. Montana: Clinton, Helena. Nevada: Baker, Lake Tahoe, Little Valley in Washoe Co. New Mexico: Cloudcroft, Las Vegas Hot Springs, San Lorenzo, Taigue in Apache Canyon. Oregon: Algoma, Ashland, Deschutes N.F., Prineville, Sisters. Paisley, 4 -mile creek in Klamath Co. Utah: Beaver, La Sal Mts., Bryce Canyon N.P., Kamas, Pin Hollow in Fishlake N.F., Elk Park in Ashley N.F., Yellowstone R.S. in Ashley N.F. Washington: Buckeye. Wyoming: Lusk.

Hosts.- Pinus coulteri, P. jeffreyi, P. lambertiana, P. ponderosa, P. strobiformis.

Biology.- This abundant species breeds in the leaf bearing portion of small branches.

Notes.- The above treatment was based on the LeConte syntypes and on 763 other specimens.

## 105. Pityophthorus montezumae Bright

Pityophthorus montezumae Bright, 1978, Great Basin Nat. 38:8I (Holotype, female; 11 km or 7 miles E San Cristóbal. Chiapas, Mexico; Canadian Nat. Coll.)
Diagnosis.- This species is distinguished from schwarzi Blackman by the different frons and declivity as described below and by the reticulate pronotum.

Female.- Length 2.3-2.5 mm, 2.5 times as long as wide; color brown.

Frons flat (not usually impressed as on type), more densely punctured than in schwarzi.

Pronotum as in schwarzi except anterior margin more finely serrate, posterior areas reticulate.

Elytra similar to schwarzi except declivital interstriae 1 armed by a row of fine granules and bearing setae as long as those on 3 .

Male. - Similar to female except frons convex, rather coarsely punctured, reticulate, median carina slightly longer than in male schwarzi.

Distribution.-Chiapas.
MEXICO: Chiapas: 11 km E San Cristóbal, 13-V-69, Pinus montezuma. Bright.

Notes.- The above treatment was based on the type series of 25 specimens.

## 106. Pityophthorus schwarizi Blackman

Pityophthorus schwarzi Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:71 (Holotype, female; Las Vegas Hot Springs, New Mexico: U.S. Nat. Mus., 41288)

Diagnosis.- This species is distinguished from crassus Blackman by the smaller size, by larger, more nearly circular outline of the antennal club, by the shorter, subdentate carina on the male frons, by the higher, shorter lateral summit on the male declivity, by the hosts, and by other characters.

Female.- Length $1.8-2.5 \mathrm{~mm}, 2.5$ times as long as wide; color dark brown.

Frons plano-convex to almost flat from eye to eye from epistoma to slightly above upper level of eyes; surface smooth and shining, punctures very fine, spaced in central area by two to four diameters of a puncture, more closely and more coarsely in marginal areas, lateral margins subabrupt; vestiture moderately abundant, almost uniformly distributed, only slightly longer on margins, longest setae equal to about one-third distance between eyes. Antennal club as long as scape, 1.12 times as long as wide.

Pronotum 1.0 times as long as wide; outline as in confinis LeConte; posterior areas smooth, shining, punctures rather fine, moderately close, median line broadly
impunctate. Vestiture of fine, rather short hair on dise and sides.

Elytra 1.6 times as long as wide, 1.6 times as long as pronotum; outline and dise about as in confinis. Declivity steep, rather narrowly sulcate; striae 1 and 2 obsolete; interstriae 1 distinctly elevated, usually unarmed, a few minute granules sometimes present on upper half, 2 two to three times as wide as 1 , moderately impressed, ascending laterally from its median margin, surface shining, with numerous impressed points, 3 much higher than 1, armed by about six small tubercles, about two smaller tubercles in lateral areas. Interstrial setae on disc not longer than distance equal to width of an interstriae, up to twice as long on declivity.

Male. - Similar to female except frons moderately, rather abruptly impressed from near epistoma to upper level of eyes, a strongly elevated, laterally compressed, short, dentate carina just below middle, without any indication of a dorsal continuation, vestiture sparse, short, inconspicuous; declivity with lateral convexities more strongly, subacutely elevated to middle, discontinued below middle, summit armed by about four tubercles, about two additional tubercles present in lateral areas of lower half, these not in line with tubercles on crest.

Distribution.-Utah to Tlaxcala.
USA: Arizona: Jacob’s Lake, Lake Roberts, Pinelino Mts., Santa Rita Mts. New Mexico: Clines Corners in Torrance Co., Emery Pass, Kingston, Lake Nogal, La Placita, Las Vegas, Magdalena, Mangano N.F., Mimbres, Quemado, Sandia Mts., San Lorenzo. Texas: Big Bend N.P., Davis Mts. Utah: Beaver, Duchesne, Gooseberry area in Fishlake N.F., Panguitch. MEXICO: Coahuila: Puesto de Flores, Saltillo. Durango: $37 \mathrm{~km}, 70 \mathrm{~km}$, and 96 km W Durango, El Palmito. Hidalgo: Jacala, Tulancingo, Zimapán. Nuevo León: Cerro Potosí, Monterey, San Roberto. Quertaro: Landa de Matamores. Tlaxcala: Tlaxco. State?: Canada del Lobo (1969, pino negro, Islas).

Hosts.-Pinus cembroides, P. edulis, P. greggii, P. lumholtzii, P. montezuma, P. teocote.

Biology.- This species was taken from small branches.

Notes.- The above treatment was based on the holotype of schwarzi and on 446 other specimens.

Following my study of more than 380 specimens of schwarzi it became apparent that a division of the species cannot be based on the female frontal vestiture and body size. Although one series is slightly larger and the female vestiture is much longer and more abundant than normal, it must be recognized that both characters are variable within and between series and cannot be used to distinguish populations. Other characters such as punctation, details in sculpture of the frons and elytra, etc. also vary within and between populations without an apparent pattern.

## 107. Pityophthorus crassus Blackman

Pityophthorus crassus Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:67 (Holotype, female; Capitan, New Mexico; U.S. Nat. Mus., 41285)

Diagnosis.- This species is distinguished from schwarzi Blackman by characters summarized in the above key and in the diagnosis of schwarzi and by other characters mentioned below.

Female.- Length $2.5-2.9 \mathrm{~mm}, 2.4$ times as long as wide; color very dark brown.

Frons as in schwarzi except punctures tend to average slightly larger and very slightly more abundant. Antennal club slightly shorter than scape, 1.25 times as long as wide.

Pronotum and elytra as in schwarzi except discal setae equal in length to one to three times width of an interstriae, those on declivity little if any longer.

Male-S Similar to male schwarzi except male frontal carina usually with a weak continuation extending to upper level of eyes; declivity with lateral crests usually declining more gradually toward apex, usually with one or more tubercles on lower half in line with those on crest of upper half.

Distribution.- Wyoming to Oaxaca and Veracruz.

USA: Arizona: Alpine, Chiricahua Mts., Flagstaff, San Francisco Mts., Santa Catalina Mts. Colorado: Colorado N.F., Breckenridge, Fort Collins, Halfway, Larkspur, Longmont, Manitou, Woodland Park. New Mexico: Boreal in the Sierra Blanca Mts., Capitan, Clouderoft, Manzano N.F., Emery Pass, Meek, Sapollo. Texas: Guadeloupe Mts., N.P. Wyoming: Laramie, Lusk. MEXICO: Durango: 96 km W Durango, El Salto, La Ciudad. Mexico: Cuernavaca, Tequesquinahua. Nuevo León: Cerro Potosí. Oaxaca: Oaxaca, Valle Nacional. Tlaxcala: Tlaxco. Veracruz: Las Vigas, Orizaba, Texcoco.

Hosts.- Pinus ayacahuite, P. contorta (rare), P. leiophylla, P. ponderosa, P. strobiformis (rare).

Biology.- Specimens were taken from twigs and small branches.

Notes. - The above treatment was based on the holotype of crassus and on 655 other specimens.

Two series in the U.S. National Museum from (1) Key West, Florida, 1 Oct. 1903, Hopk. U.S. 288, Pinus, A. D. Hopkins, and (2) Tryon, North Carolina, Castanea dentata, Hopk. U.S. 3033, W. F. Fiske, are considered by me to be mislabeled series of crassus and do not record this species from the eastern half of the USA.

## 108. Pityophthorus laetus Wood

Pityophthorus laetus Wood, I977, Great Basin Nat. 36:358 (Holotype, female; Volcán Poas, Heredia, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished by the small, elongate, aseptate antennal club, by the pronotum which has asperities extending to near the basal margin, and by the simple elytra.

Female.- Length $1.6-1.7 \mathrm{~mm}, 2.6$ times as long as wide; color black.

Frons flat from eye to eye, from epistoma to above eyes (concealed by pronotum above eyes), epistomal margin narrowly, weakly elevated; surface smooth, shining, punctures very fine, shallow, very sparse on central two-thirds, more numerous toward margins, margins rounded; vestiture of fine long hair on margins, a few sparse, shorter hairs in central area, longest setae equal in length to about half distance between eyes. Antennal club slightly longer than scape, 1.6 times as long as wide, smooth, shining, glabrous on anterior face, not septate, suture 1 obsolete, 2 very feebly indicated on surface by a procurved line on apical half, sutural constrictions and setae confined to margins.

Pronotum 1.05 times as long as wide; widest on basal third, sides moderately arcuate on basal third, almost straight and converging on middle third, rather narrowly rounded in front, anterior margin armed by 10-14 rather coarse serrations; summit indefinite, at or slightly behind middle; asperities small, numerous, continuing in declining, subparallel, somewhat indistinct rows
almost to base; posterior areas shining, with numerous impressed points, punctures small, spaced by two to four or more diameters, those in lateral areas mostly associated with subasperate lines. Vestiture of short, sparse hair, glabrous on disc.

Elytra 1.7 times as long as wide, 1.6 times as long as pronotum; sides almost straight and parallel on basal two-thirds, rather narrowly rounded behind; striae not impressed, punctures very fine, shallow, spaced by two to four diameters of a puncture, in rows; interstriae three to four times as wide as striae, surface smooth, brightly shining, with many obscurely impressed points and irregular lines, a few fine punctures on odd-numbered interstriae on posterior half. Declivity steep, convex; striae not impressed, punctures slightly smaller than on disc; interstriae 1 very feebly elevated, higher than 3,2 as wide as 1 or 3 , very feebly impressed, impunctate, 1 and 3 with a row of minute granules. Minute strial setae on declivity, odd-numbered interstriae on dise with rather widely spaced, erect, moderately long, stout hair, declivity with all interstriae except 2 with similar setae.

## Distribution.- Costa Rica.

COSTA RICA: Volcán Poas, Heredia, 19-XI-63, 2500 m , No. 261, tree branch, 8 cm in diameter, S. L. Wood.

Notes. - The above treatment was based on the type series of three female specimens.

## 109. Pityophthorus lenis Wood

Pityophthorus lenis Wood, 1976, Great Basin Nat. 36:358 (Holotype, female; Tapantí, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished by the large, elongate, obovate antennal club with aseptate, rather obscure sutures, by the strongly reticulate pronotal disc, and by the simple elytral sculpture.

Female.- Length 1.2-1.4 mm, 2.8 times as long as wide; color brown.

Frons transversely, broadly concave, transversely impressed from epistoma to upper level of eyes (longitudinally concave); surface reticulate, median third impunctate from epistoma to vertex, lateral areas rather coarsely, closely punctured; punctured areas ornamented by long, moderately abundant hair, longest setae equal in length to about two thirds distance between eyes. Antennal
club 1.7 times as long as scape; club 1.3 times as long as wide, obovate, widest on apical third, anterior face shining, glabrous except for short setae along sutures, sutures aseptate, marked by a fine line and a row of short setae.

Pronotum 1.05 times as long as wide; sides on basal half subparallel, feebly arcuate, rather narrowly rounded in front; anterior margin subcostate, armed by 10-12 low, basally fused serrations; pronotum reticulate, punctures in posterior areas rather small, moderately close. Glabrous except in marginal areas.

Elytra 1.6 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel, rather broadly, irregularly rounded behind; striae 1 weakly impressed near declivity, others not impressed, punctures fine, becoming minute near declivity, in rows; interstriae almost smooth, shining, impressed points appearing as minute, confused punctures, punctures absent. Declivity steep, shallowly bisulcate; striae obsolete; interstriae 1 moderately, abruptly elevated, 2 almost twice as wide as 1 , rather strongly, broadly impressed, smooth, shining, obscure points indicated, 3 as high as 1 , rounded, armed by about four very fine tubercles. Vestiture confined to odd-numbered interstriae, of widely spaced, erect, rather short, slender bristles.

Male. - Similar to female except frons broadly, evenly convex, coarsely, rather closely punctured, a weak median tubercle on epistoma, vestiture short, sparse, inconspicuous.

Distribution.- Costa Rica.
COSTA RICA: Tapantí, Cartago, 24-X-63, 1300 m , No. 244, liana, S. L. Wood.

Notes.- The above treatment was based on the type series of 13 specimens.

## 110. Pityophthorus parilis Wood

Pityophthorus parilis Wood, 1976, Great Basin Nat. 36:359 (Holotype, female; Buenos Aires, Cortez, Honduras; Wood Coll.)
Diagnosis.- This species is distinguished from guatemalensis Blandford by the more coarsely sculptured female frons, by the more coarsely punctured elytral striae, by the more shallowly sulcate elytral declivity, and by other characters.

Female.- Length $1.6-1.7 \mathrm{~mm}, 2.8$ times as long as wide; color very dark brown.

Frons flat from epistoma to vertex, from eye to eye, subangulate margin separated from margin of eye by distance equal to width of three facets; surface smooth, shining, rather coarsely, closely, uniformly, deeply punctured; vestiture rather abundant, uniformly distributed, distinctly longer at margins, longest setae about equal to onethird distance between eyes.

Pronotum 1.1 times as long as wide; outline as in guatemalensis; posterior areas weakly reticulate, punctures rather fine, moderately close. Glabrous except at margins.

Elytra 1.6 times as long as wide, 1.5 times as long as pronotum; outline and disc as in guatemalensis except interstriae only slightly wider than striae. Declivity as in guatemalensis except steeper and much less strongly bisulcate. Vestiture confined to declivity, stouter than in guatemalensis.

Distribution.- Honduras.
honduras: Buenos Aires, Cortéz, 7 -V-64, 2300 m , No. 578, Quercus S. L. Wood.
Biology.-Specimens were taken from a broken branch 4 cm in diameter.

Notes.- The above treatment was based on the type series of three female specimens.

## 111. Pityophthorus scitulus Wood

Pityophthorus scitulus Wood, 1976, Great Basin Nat. 36:359 (Holotype, female: Volcán Chiriquí, Chiriquí, Panama; Wood Coll.)
Diagnosis.- This species is distinguished from guatemalensis Blandford by the coarser strial punctures, by the steeper, more strongly sulcate declivity, and by the much more coarsely punctured declivital striae 1 and 2 .

Female.- Length $1.8-2.1 \mathrm{~mm}, 3.2$ times as long as wide; color brown.

Frons essentially as in guatemalensis except more finely punctured, central area on lower half more extensively impunctate, lateral margins of flattened area separated from eye by distance equal to width of one facet, vestiture much more abundant on margins, shorter in central area, longest setae equal to more than half distance between eyes.

Pronotum 1.25 times as long as wide; outline basically similar to guatemalensis; posterior areas with surface smooth, shining, small
and minute punctures intermixed. Glabrous except at margins.

Elytra 1.9 times as long as wide, 1.6 times as long as pronotum; sides straight and parallel on basal three-fourths, rather abruptly rounded, then subacuminate behind; striae not impressed except 1 near declivity; interstriae smooth, shining, punctures coarse, very close; interstriae smooth, shining, with obscure, fine transverse lines, impressed points appearing as fine, confused punctures, punctures absent. Declivity steep, rather strongly bisulcate, apex subacuminate; striae 1 and 2 very coarsely punctured, punctures appear confused on some specimens; interstriae slightly elevated, finely punctured, 2 strongly sulcate, narrowly above, broadly below, shining, space almost entirely occupied by strial punctures, 3 slightly higher than 1 and armed by two pairs of pointed denticles on upper half, an additional granule present on lower third, lateral areas rather coarsely punctured. Vestiture of moderately long interstrial hair on base and lateral areas of declivity.

Male. - Similar to female except frons broadly convex, coarsely, closely punctured, vestiture short, sparse, inconspicuous; declivity more strongly impressed, lateral denticles distinctly larger.

Distribution.- Costa Rica and Panama.
COSTA RICA: Tapantí, Cartago, 2-VII-63, 1300 m , No. 6, Quercus limb, S. L. Wood. PANAMA: Volcán Chiriquí, Il-I-64, 1600 m , Qucrcus limb, S. L. Wood.

Notes.- The above treatment was based on the type series of 25 specimens.

## 112. Pityophthorus conspectus Wood

Pityophthorus conspectus Wood, 1976, Great Basin Nat. 36:360 (Holotype, female; Volcán Irazu, Cartago, Costa Rica: Wood Coll.)
Diagnosis.- This species is distinguished from guatemalensis Blandford by the less extensively flattened female frons, with the vestiture much shorter and less abundant, by the coarser pronotal punctures, and by the very different declivity described below.

Female.- Length $1.6-1.8 \mathrm{~mm}, 2.8$ times as long as wide; color very dark brown.

Frons as in guatemalensis except less extensively flattened, margin of flattened area separated from margin of eye by distance equal to width of five facets, not extending as
high on vertex; vestiture moderately abundant on smaller area, longest setae equal to about one-third distance between eyes. Antennal club larger and more nearly circular than in guatemalensis, sutures 1 and 2 rather strongly procurved (almost straight in guatemalensis).

Pronotum 1.1 times as long as wide; as in guatemalensis except punctures on posterior areas much coarser.

Elytra 1.7 times as long as wide, 1.7 times as long as pronotum; outline and disc as in guatemalensis. Declivity steep, convex; striae 1 and 2 not impressed, punctures very fine; interstriae 1 feebly elevated, armed by two or three very fine granules, 2 flat, as wide as 1 , not impressed, impunctate, 3 not elevated, armed by a row of about five small granules. Vestiture consisting of erect, short, interstrial setae on posterior third of disc and declivity except absent on declivital interstriae 2 .

Male. - Similar to female except frons weakly convex, a median callus on upper half, coarsely punctured, vestiture short, sparse, inconspicuous.

Distribution.- Costa Rica.
COSTA RICA: Volcán Irazu, Cartago, 26-IX-63, 2300 m, No. 208, tree branch (probably Quercus), S. L. Wood.

Notes.- The above treatment was based on the type series of three specimens.

## 113. Pityophthorus medialis Wood

Pityophthorus medialis Wood, 1976, Great Basin Nat. 36:361 (Holotype, female; Volcán Irazu, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from guatemalensis Blandford by the moderately procurved sutures of the antennal club, by the more posterior position of the summit of the pronotum, by the punctured discal interstriae, by the steeper, less strongly sulcate elytral declivity, and by other characters, described below.

Female.- Length 1.9-2.4 mm, 2.6 times as long as wide; color dark brown.

Frons similar to guatemalensis except more extensively flattened, pubescent area separated from margin of eye by distance equal to diameter of three facets, vestiture more abundant, slightly shorter. Antennal club with sutures 1 and 2 moderately procurved.

Pronotum 1.1 times as long as wide; similar to guatemalensis except summit distinctly behind middle, low crenulations extending to base on sides and lateral areas of disc, punctured area on disc about half as large as in guatemalensis (about one-third width of pronotum).

Elytra 1.7 times as long as wide, 1.6 times as long as pronotum; outline and dise as in guatemalensis except interstriae each with a sparse row of punctures, punctures about equal in size to those of striae. Declivity steep, convex; similar to guatemalensis but steeper, sulcus perhaps half as deep, tubercles on interstriae 1 and 3 slightly larger. Vestiture of minute strial hair and moderately long, erect, fine interstrial setae on disc and declivity, except largely absent on declivital interstriae 2.

Male. - Similar to female except frons convex, a slight transverse impression above epistoma, surface shining, closely, deeply, rather coarsely punctured, vestiture short, sparse, inconspicuous; declivital sulcus deeper, broader, similar to female guatemalensis.

Distribution.-- Costa Rica.
COSTA RICA: Cerro de la Muerte, 1-VIII-66, 3200 m. No. 45, Quercus, S. L. Wood; Volcán Irazu, Cartago, 26-1X-63, 2300 m , Quereus branch, S. L. Wood.

Biology.- Specimens were taken from broken Quercus branches less than 10 cm in diameter.

Notes.- The above treatment was based on the type series of 63 specimens.

## 114. Pityophthorus guatemalensis Blandford

Pityophthorus guatemalensis Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):239 (Syntypes: Guatemala City, Zapote, Calderas, Capetillo, and Quiché Mts. Guatemala; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from quercinus Wood by the smaller size and by the female frons as described below.

Female.- Length $1.8-1.9 \mathrm{~mm}, 2.8$ times as long as wide; color brown.

Frons as in quercinus except more distinctly convex, punctured only on median half below upper level of eyes, small, median, smooth, shining, area on lower third distinctly carinate (not at all carinate in quercinus), vestiture confined to median half of area below upper level of eyes (in quercinus
pubescence much more abundant and more widely distributed, occupying at least median two-thirds and at least one-third of setae are above upper level of eyes.)

Distribution.-Guatemala, at the sites listed above.

Notes.- The above was based on more than a dozen female syntypes. It appears necessary to recognize quercinus as a distinct species until clear evidence of intergradation is found rather than follow Bright's (1977:514) recommendation of synonymy. Although all females of guatemalensis do not have an acute frontal carina, all do have a median elevation that is at least subcarinate; the median summit seen in some quercinus females is quite different.

## 115. Pityophthorus quercinus Wood

Pityophthorus quercinus Wood. 1967, Great Basin Nat. 27:40 (Holotype, female; 3 miles W El Salto, Durango, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from other Quercus infesting representatives of the genus by the straight antennal sutures 1 and 2 , by the minute declivital striae 1 and 2 , and by the sculpture of the elytral declivity.

Female.- Length 1.9-2.4 mm, 2.8 times as long as wide; color dark brown.

Frons broadly flattened from epistoma to well above eyes, lateral margins of pubescent area separated from eye by distance equal to diameter of six facets; surface smooth, shining, finely, closely, rather deeply punctured except almost impunctate on small median area on lower half; vestiture moderately abundant, rather long, longest setae slightly longer than one-third distance between eyes, at least one-third of setae above upper level of eyes. Antennal club comparatively small, 1.14 times as long as wide, sutures 1 and 2 almost straight, 2 at middle of club.

Pronotum 1.2 times as long as wide; widest on basal half, sides on more than basal half feebly arcuate, converging very slightly, rather broadly rounded in front; anterior margin costate, broadly, weakly serrate; summit slightly anterior to middle; low asperities extending to base in lateral areas, disc on median half of pronotum smooth, shining, with numerous impressed points, punctures rather
small, moderately abundant, spaced by distances about equal to diameter of a puncture. Glabrous except at margins.

Elytra 1.7 times as long as wide; 1.6 times as long as pronotum; sides almost straight and parallel on basal two-thirds, rather narrowly rounded behind; striae not impressed except 1 moderately, punctures rather small, close, deep; interstriae twice as wide as striae, smooth, shining, with moderately abundant, confused impressed points resembling minute punctures, impunctate. Declivity rather steep, broadly, moderately sulcate; striae 1 and 2 not impressed, punctures distinct, about half as large as on disc; interstriae smooth, shining, with numerous impressed points, 1 moderately, abruptly elevated, armed by about four widely spaced moderately coarse, rounded tubercles, 2 as wide as 1, flat, rather strongly impressed, impunctate, 3 as high as 1 , rounded, armed by about four tubercles similar to those on 1 . Vestiture confined to base and sides of declivity and interstriae 1 almost to base, of minute strial hair and rather short, erect interstrial setae, absent on declivital interstriae 2.

Male. - Similar to female except frons strongly convex on slightly more than upper half, lower area rather strongly, transversely impressed, surface smooth, shining, coarsely, very closely, deeply punctured, vestiture short, sparse, inconspicuous; declivital sulcus much more strongly impressed, tubercles on interstriae 1 and 3 much larger, pointed.

Distribution.- Durango to Michoacán and Oaxaca.

MEXICO: Durango: 5 km W El Salto, l-VII-65, 2500 m, Nos. 32, 33. Quercus, S. L. Wood. Michoacán: 5.3 km E Morelia, 14-Vi-65, 3000 m , No. 51. Quercus. S. L. Wood. Oaxaca: 225 km S Oaxaca on Highway 131, 27-30-V-71, 2000 m , Quercus, D. E. Bright.

Host.-Quercus spp.
Biology.- Specimens were taken from the lower bole of dying trees about 80 cm in diameter.

Notes.- The above treatment was based on the holotype of quercinus and on 93 other specimens.

The Oaxaca series has the female frons less extensively pubescent than normal, but it lacks a median carina. Although this suggests an intermediate condition between this species and guatemalensis, it is too soon to
propose synonymy between these species, as was done by Bright (1977:514).

## 116. Pityophthorus subopacus Blackman

 Fig. 200Pityophthorus subopacus Blackman, 1942, Proc. U.S. Nat. Mus. 92:210 (Holotype, male?; Chalco, Mexico, Mexico; U.S. Nat. Mus., 55985)
?Pityophthorus elimatus Bright, 1976, Great Basin Nat. 36:4.32 (Holotype, female; 51 mi or 81 km NW Oaxaca, Oaxaca, Mexico; Canadian Nat. Coll.). Probable synonymy
Diagnosis.- This species is distinguished by the elongate body, with the elytra more than twice as long as the pronotum, by the reticulate elytral disc, with impunctate interstriae, and by the simple frons and declivity as described below. It intergrades to a remarkable degree with segnis (see Notes under segnis).

Female.- Length $1.6-2.0 \mathrm{~mm}, 2.9-3.0$ times as long as wide; color brown.

Frons weakly convex on median threefourths from near epistoma to slightly above eyes, a slight, median, epistomal tubercle or short, low, obscure carina usually present; surface reticulate, rather coarsely, closely, somewhat obscurely, uniformly punctured; vestiture fine, rather sparse, moderately long, not very conspicuous.

Pronotum 1.03 times as long as wide; widest on basal third, sides on basal half moderately arcuate, a feeble constriction on anterior half, rather broadly rounded in front; anterior margin armed by about eight moderately coarse, basally separate serrations, median ones distinctly larger; summit at or slightly in front of middle, high; posterior areas reticulate, coarsely, deeply, closely punctured. Vestiture fine, short.

Elytra 2.0 times as long as wide, 2.0 times as long as pronotum; sides almost straight and parallel on basal three-fourths, rather broadly rounded behind; striae not impressed, punctures coarse, deep, close; interstriae feebly to strongly reticulate, as wide as striae, impunctate except for an occasional puncture near declivity. Declivity steep, convex; striae 1 and 2 feebly impressed, punctures almost as coarse, as on disc; interstriae 2 usually feebly impressed, impunctate, as wide as 1,1 and 3 feebly elevated and each armed by a row of about four to six rounded granules. Vestiture
of fine, short strial hair on disc and declivity and on declivity of rather long, coarse hair on odd-numbered interstriae, shorter on 1.

Male.- Similar to female except frons more distinctly convex, obtuse median carina usually slightly longer and higher, vestiture short, sparse, inconspicuous.

Distribution.- Durango and Nuevo León to Michoacán and Veracruz.

MEXICO: Durango: 64 km W Durango; 9 km NE El Salto. Nuevo León: Cerro Potosí. Michoacán: 9 km E Volcán Parícutin. Oaxaca: 81 km NW Oaxaca. Puebla: 23 km W Texmelucan; Río Frío. Tlaxcala: 17 km N Tlaxco. Veracruz: Jalapa, 9-II-36, P. montezuma, D. DeLeon.

## Hosts.- Pinus spp.

Biology.- Specimens were taken from branches 5 cm in diameter.

Notes. - The above treatment was based on the holotype of subopacus and on 36 other specimens. The type appears to be a male, not a female as indicated in the original description. The type series of elimatus consists of material slightly larger (2.0-2.2 mm ) and very slightly stouter ( 2.9 times as long as wide) than most specimens. The frontal and pronotal characters are within the limits of variation of this species. It possibly might represent a distinct geographical race, but more material is needed to evaluate its status.

## 117. Pityophthorus impexus Bright

Pityophthorus impexus Bright, 1978, Creat Basin Nat. 38:76 (Holotype, female, 10 km S Carapan, Michoacán, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from subopacus Blackman by the more distinctly impressed declivital interstriae 2 , by the differences in the frons noted below, and by the much longer vestiture on the elytral declivity.

Female.- Length $1.5-2.0 \mathrm{~mm}, 2.5$ times as long as wide; color rather dark brown.

Frons as in subopacus except less distinctly convex, surface shining, punctures smaller, more sharply defined, without indications of a median carina, vestiture much longer, at least twice as abundant.

Pronotum as in subopacus except disc less strongly reticulate.

Elytra as in subopacus except declivital striae 1 more strongly impressed, all or part
of declivital interstriae 2 more strongly sulcate, and declivital vestiture more abundant, coarser, much longer.

Male.-Similar to female except frons. Frons much as in subopacus male except shining, more nearly flattened on lower half and with a short, acute carina on lower half (somewhat variable).

Distribution.- Durango and Michoacán to Mexico.

MESICO: Durango: 5 km W El Salto, 7 -Vi-65, 2500 m, No. 33, Pinus ayacahuite, S. L. Wood. Mexico: Tequesquinahua, III-62, Pinus, R. Coronado. Michoacán: 10 km S Carapan, 18 -VI-65, 2300 m , No. 79, Pinus, S. L. Wood; 9 km E Volcán Parícutin. 19-V1-65, 2500 m , No. 89, Pinus, S. L. W'ood.

Hosts.- Pinus ayacahuite, P. sp.
Biology. - Specimens were taken from material $5-10 \mathrm{~cm}$ in diameter, in branches and in seedlings.

Notes.- The above treatment was based on 20 specimens from the type series.

## 118. Pityophthorus anthracinus Bright

Pityophthorus anthracinus Bright, 1976, Great Basin Nat. 36:428 (Holotype, female; Cerro Potosi, Nuevo León, Mexico; Wood Coll.।
Diagnosis.- This species is distinguished from nocturnus Blandford by the different frons as described below, by the smaller strial punctures, by the more irregular interstriae, and by other characters.

Female.- Length $1.6-1.7 \mathrm{~mm}, 2.9$ times as long as wide; color almost black.

Frons flat, with epistomal margin slightly elevated; surface smooth, shining, coarsely, very closely punctured, interspaces averaging less than half diameter of a puncture; vestiture moderately abundant, moderately long, uniformly distributed, little if any longer on margins (not clear, hair matted in type series).

Pronotum essentially as in nocturnus except dise smooth, punctures larger.

Elytra about as in nocturnus except strial punctures smaller, interstriae more irregular, with more impressed lines, declivital sulcus not as deep, smoother, punctures smaller. apex more nearly subacuminate.

Male.-Similar to female except frons weakly convex, obscure punctures rather coarse, carina absent.

Distribution.- Nuevo León.

MEXICO: Nuevo León: Cerro Potosí, 21-III-74, Hopk. 58614 , Abies, M. M. Furniss.

Notes.- The above treatment was based on the type series of nine specimens.

## 119. Pityophthorus nocturnus Schedl

 Fig. 200Pityophthorus nocturnus Schedl, 1938, Archiv Naturgesch. 7:185 (Lectotype, male; San Geronimo, Verapaz, Guatemala; British Mus. Nat. Hist., designated by Bright, 1976, Coleopt. Bull. 30:186)
Pityophthorus hidalgoensis Blackman, 1942. Proc. U.S. Nat. Mus. 92:15 (Holotype, female: Jacala, Hi(dalgo, Mexico: U.S. Nat. Mus., 55989); Bright, 1977. Canadian Ent. 109:516. Synonymy

Diagnosis.- This species is distinguished by the absence of discal interstrial punctures, by the shallowly sulcate elytral declivity, and by the weak longitudinal male carina.

Female.- Length $1.5-1.9 \mathrm{~mm}, 2.6$ times as long as wide; color dark brown.

Frons usually almost flat from eve to eye from vertex to near epistoma, ascending toward epistoma (some Guatemalan specimens partly concave); surface smooth, shining, very finely, uniformly, densely punctured, margin of pubescent area separated from margin of eye by distance equal to width of two facets; vestiture of fine, uniformly distributed hair, rather short in central area, longer on lower lateral margins, becoming very long on upper margin, longest setae equal to half distance between eyes. Posterior base of mandible ornamented by a small, distinctive tuft of setae.

Pronotum 1.1 times as long as wide; outline essentially as in subopacus Blackman; posterior areas reticulate, punctures rather fine, moderately close. Glabrous except at margins.

Elytra 1.7 times as long as wide, 1.7 times as long as pronotum; sides almost straight and parallel on basal two-thirds, rather narrowly rounded behind; striae not impressed except 1 narrowly near declivity, punctures rather small, deep, slightly smaller toward declivity; interstriae twice as wide as striae, smooth, shining, impunctate. Declivity steep, narrowly, shallowly sulcate; striae 1 and 2 not impressed, punctures minute but distinct; interstriae 1 narrowly, abruptly, distinctly elevated, armed by a few very fine granules, 2 almost twice as wide as 1 , smooth, shining,
ascending from mesal margin in some specimens, more broadly impressed in others, 3 slightly higher than 1 , rounded, armed by about six minute granules. Vestiture confined to sides and declivity, very sparse, short, mostly on odd-numbered interstriae; strial setae obsolete.

Male.- Similar to female except frons distinctly impressed below upper level of eyes, an obtuse median carina extending from epistoma to upper level of eyes, surface smooth, shining, rather finely impressed, vestiture short, inconspicuous; serrations on anterior margin of pronotum much coarser; lateral convexities of elytral declivity distinctly higher.

Distribution.- Hidalgo to Guatemala.
MEXICO: Chiapas: 8 km N Bochil, 3-VII-69, Pinus strohus var. chiapensis, D. E. Bright; 8 km SW El Bosque, 3-VII-69, Pinus, D. E. Bright, Lagos des Colores, 14-VI-69, Pinus, D. E. Bright. Hidalgo: Jacala, 18-I-36, Pinus lausoni, D. DeLeon. Veracruz: Las Vigas, 5-VII67, No. I56, Pinus, S. L. Wood. GUATEMALA: Guatemala City, 30-V-64, 1300 m , Pinus pseudostrobus, S. L. Wood; San Geronimo, Voleán de Agua, 19-V-64, 1000 m , No. 596, P. pseudostrobus, S. L. Wood.

Hosts.- Pinus lawsoni, P. pseudostrobus, P. strobus var. chiapensis.

Biology.- Specimens were taken from branches.

Notes.- The above treatment was based on the Schedl syntypes of nocturmus, on the holotype of hidalgoensis, and on 48 other specimens.

The type series of hidalgoensis consists of specimens smaller than normal and with the punctures on the pronotal disc much larger than seen in other specimens. The placement of this name in synonymy must be considered tentative until more material is examined.

## 120. Pityophthorus mesembria Bright

Pityophthorus mesembria Bright, 1978, Great Basin Nat. 38:80 (Holotype, female; Cerro Calel. Quezaltenango, Guatemala; Wood Coll.)
Diagnosis.- This unique species is distinguished by the absence of discal interstrial punctures, by the evenly convex, coarsely punctured male frons that lacks a carina, by characters of the female frons described below, and by the rather strongly sulcate elytral declivity.

Female.- Length 1.9-2.2 mm, 2.8 times as long as wide; color very dark brown.

Frons broadly flat from epistoma to well above eyes, a feeble transverse impression on lower half; surface smooth, shining, coarsely, closely, deeply, uniformly punctured, interspaces averaging slightly more than half diameter of a puncture in width; vestiture fine, minute, inconspicuous in central area, a dense row of very long setae on lateral and upper margins, tips of longest dorsal setae reach epistoma.

Pronotum essentially as in pulchellus Eichhoff except punctures on posterior half much smaller, less numerous, lateral margin of each puncture extended slightly mesad, giving punctures elongate shape.
Elytra about as in pulchellus except strial punctures distinctly smaller, interstrial punctures absent, declivity slightly steeper with sulcus slightly narrower, declivital striae 2 with fine punctures clearly impressed, interstriae 1 and 3 each with 8 to 10 fine tubercles, vestiture less abundant, slightly shorter.

Male.-- Similar to female except frons broadly convex, coarsely punctured, carina not indicated.

Distribution.-- Guatemala.
CUATEMALA: Quezaltenango: Cerro Calel, 26-V-64, 3300 m , No. 621, Abies guatemalensis branches, S. L. Wood.

Notes. - The above treatment was based on the type series of seven specimens.

## 121. Pityophthorus cascoensis Blackman

Pityophthorus cascoensis Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:99 (Holotype. female; Peak Istand, Maine; U.S. Nat. Mus., 4130.3)

Pityophthorus pilifer Schedl, 19:31, Canadian Ent. 63:166 (Holotype, female: Frater, Ontario; Canadian Nat. Coll., 3170); Bright. 1977, Canadian Ent. 109:515. Synonymy
Diagnosis.- This species is distinguished from intextus Swaine by the convex male frons with a weak median carina on the lower half, by the presence of regularly spaced setae on declivital interstriae 1 , by the sparsely punctured discal interstriae, and by characters on the female frons.

Female.- Length $1.6-2.2 \mathrm{~mm}, 2.6$ times as long as wide; color dark brown.

Frons variable, from weakly convex, rather coarsely, closely punctured and subglabrous
to flat on median three-fourths from epistoma to above eyes, punctures fine, dense, vestiture abundant, uniformly distributed, of uniform length, each equal to about one-third distance between eyes; short, recumbent, scalelike setae never present as in intextus.

Pronotum 1.1 times as long as wide; sides almost straight and parallel on basal half, a feeble constriction on anterior half, rather broadly rounded in front; anterior margin armed by about 10 rather coarse serrations; summit at or slightly in front of middle; posterior areas smooth, shining, impressed points or obscure reticulation indicated in some specimens, punctures rather small, not close. Vestiture short, rather sparse, usually absent on disc.

Elytra 1.7 times as long as wide, 1.7 times as long as pronotum; sides almost straight and parallel on basal two-thirds, broadly rounded behind; striae not impressed except 1 slightly near declivity, punctures rather small, close, in rows except sometimes slightly confused near base; interstriae twice as wide as striae, shining, almost smooth to obscurely subreticulate, sparsely punctured (occasional specimens impunctate). Declivity steep, rather strongly sulcate; striae 1 and 2 varying from almost obsolete to finely, irregularly punctured; interstriae 1 distinctly elevated, armed by about 10 almost regularly spaced setiferous granules, 2 about twice as wide as 1 , rather strongly sulcate, shining, almost smooth, 3 slightly higher than 1 , rounded, armed by about 7 moderately coarse, setiferous tubercles. Strial setae mostly obsolete, a few sometimes present on sides or declivity; interstrial setae mostly confined to declivity, largely on odd-numbered interstriae, their length mostly twice width of an interstriae except short on declivital interstriae 1.

Male. - Similar to female except frons more strongly convex, a weak median carina of variable length usually on lower half, more coarsely punctured, usually glabrous.

Distribution.- Northwest Territories to Newfoundland and New York.

CANADA: Alberta: Banff N.P. Newfoundland: "Newfoundland." Northwest Territories: Aklavik. Ontario: Frater. USA: Maine: Boil Mountain, Peak Island. New York: Cranberry Lake.

Hosts.- Picea glauca.

Notes.- The above treatment was based on the holotypes of cascoensis and pilifer and on 95 other specimens.

## 122. Pityophthorus intextus Swaine

Fig. 206
Pityophthorus intextus Swaine, 1917, Dom. Canada Dept. Agric. Ent. Br. Tech. Bull. 14(1):29 (Holotype, male: Athabasca Landing, Alberta; Canadian Nat. Coll., 3147)
Pityophthorus shepardi Blackman. 1922, New York St. Coll. For., Syracuse, Tech. Pub. 16:124 (Holotype, female; Chamberlin Lake region, Township 7 R12, Piscataquis, Naine; U.S. Nat. Mus.); Bright, 1977. Canadian Ent. 109:515. Synonymy Pityophthorus tonsus Blackman, 1928. New York St. Coll. For., Syracuse, Tech. Pub. 25:101 (Holotype, female; Grand island, Michigan; U.S. Nat. Mus., 41304); Bright, 1977. Canadian Ent. 109:515. Synonymy
Diagnosis.- This species is distinguished from cascoonsis Blackman by the smaller average size, by the transverse impression on the lower half of the male frons, which also lacks a median carina, by the glabrous declivital interstriae 1 , and by the impunctate discal interstriae.

Female.- Length $1.4-2.0 \mathrm{~mm}, 2.6$ times as long as wide; color brown to dark brown.

Frons variable as in cascoensis except always finely punctured on a somewhat smaller area, never completely flat or as very finely punctured as in some cascoensis; vestiture minute to moderately long, long setae of uniform length, but apparently always with moderately abundant, very short, recumbent, scalelike setae in addition to long setae (visible only under oblique light from a subdorsal source; this effect may result from an abrupt curve at base of each seta rather than from short scales, not clear with available equipment.)

Pronotum and elytra as in cascoensis except declivital interstriae 1 with granules minute and devoid of setae (occasional specimens with one or two setae, but never regularly placed); discal interstriae 2-5 usually impunctate, uncommonly with an occasional puncture on anterior three-fourths, normally with sparse punctures near declivity.

Male- Similar to female except lower half of frons rather strongly, transversely impressed, never with a median carina, surface smooth, shining, coarsely punctured, subglabrous.

Distribution.- British Columbia and Wyoming to Newfoundland and West Virginia.

CANADA: Alberta: Athabasca Landing, Cypress Hills, Edmonton, Lesser Slave Lake, Peace River, Smith, Wabamun. British Columbia: Hixon, Pine Pass, Trinity Valley. New Brunswick: Portage Vale. Newfoundland: Middle Brook Prov. Park, Pasadena. Nova Scotia: Kejimkujik. Ontario: Chapleau, Ferndale, Frater, Kenora, Perry Sound, Thessalon. Saskatchewan: Canoe Lake, Cypress Hills. USA: Maine: Orono, Piscataquis, Topsfield, Wilson's Mills. Michigan: Grand Island, Seney. New Hampshire: Franconia, Webster. New York: Cranberry Lake. West Virginia: Randolph Co. Wyoming: Saratoga.

Hosts.- Picea engelmannii, P. glauca, $P$. rubens.

Notes.- The above treatment was based on the holotypes of intextus, shepardi, and tonsus and on 1026 other specimens. The paratypes of kenti from Sheridan, Wyoming, are of this species.

## 123. Pityophthorus ornatus Blackman

Pityophthorus ornatus Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:102 (Holotype, female; Manitou, Colorado; U.S. Nat. Mus., 41305)

Pityophthorus kenti Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:141 (Holotype, female; Black Hills, W yoming; U.S. Nat. Mus.); Wood, 1977. Great Basin Nat. 37:210. Synonymy Pityophthorus limatus Wood, 1964, Great Basin Nat. 24:65 (Holotype, female; Sanford Canyon, Dixie Nat. Forest, Utah; Wood Coll.); Wood, 1977, Great Basin Nat. 37:516. Synonymy
Diagnosis.- This species is distinguished from intextus Swaine by characters of the female frons, by lacking most or all of the elytral interstrial bristles, and by the host and distribution.

Female.- Length $1.6-2.3 \mathrm{~mm}, 2.7$ times as long as wide; color dark brown.

Frons plano-convex on median threefourths from epistoma to vertex; surface smooth, shining, punctures very fine, very dense, uniformly distributed; vestiture of fine, dense, long hair, all setae equal to at least one-fifth distance between eyes (Colorado specimens with a few setae on dorsal margin equal to half distance between eyes); never with any short recumbent scales as in intextus.

Pronotum and elytra as in intextus except about half of specimens without any interstrial setae longer than those of striae, long
interstrial setae when present confined to declivital interstriae 3 or 9 , never on $4-8$ (present in intextus at least on 5 and 7).

Male.-Similar to female except frons much as in male intextus except a distinctly elevated, transverse carina almost always present.

Distribution.-Utah to Wyoming and Colorado.

USA: Colorado: Manitou, Pinus edulis (accidental?): Ouray, 1-15-VIl-97, $7500-8000 \mathrm{ft}$, H. F. Wickham; Pingree Creek, Larimer Co.. 14-V1-68, Picca pungens, S. L. Wood; Poudre Canyon, Larimer Co., 9-VIII-67, P. pungens. S. L. Wood. Utah: Henry Mts., Pinus ponderosa (accidental?): Mckee Draw in Ashley N.F., 16-VI-60, P. pungens, S. L. Wood; Parowan Canyon, 20-V1-60, P. pungens, S. L. Wood; Sanford Canyon in Dixie N.F., 22-VI-60, P. pungens, S. L. Wood. Wyoming: Saratoga, 8-X38, P. pungens; Black Hills, Sheridan.

Host.- Picea pungens, rare or accidental in Pinus.

Biology.- Specimens were taken from boles and branches $3-15 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotypes of ornatus, kenti, and limatus and on 111 other specimens.

The female frontal vestiture on Utah specimens is of uniform length and equal in length to about one-fifth the distance between the eyes. In Colorado specimens setae on the dorsal margin may attain twice this length. Apparently the host of the type series of ornatus was accidental or erroneous, in that this species otherwise is unknown from Pinus edulis.

## 124. Pityophthorus infulatus Blackman

Pityophthorus infulatus Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Bull. 25:103 (Holotype, female; Sacramento Mountains, New Mexico; U.S. Nat. Mus., 41306)
Pityophthorus mollis Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:104 (Holotype, female; Tortillo Canyon, New Mexico: U.S. Nat. Mus., 41307); Bright, 1977, Canadian Ent. 109:514. Synonymy
Pityophthorus hubbardi Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:105 (Holotype, female; Chiricahua Mountains, Arizona; U.S. Nat. Mus., 41308); Bright, 1977, Canadian Ent. 109:514. Synonymy
Diagnosis.- This species is distinguished from ornatus Blackman by the very long female frontal vestiture, by the more nearly reticulate pronotum, and by the less strongly impressed male frons.

Female.- Length $1.5-2.0 \mathrm{~mm}, 2.6$ times as long as wide; color dark brown.

Frons as in ornatus except more extensively flattened to within distance of one or two diameters of a facet from margin of eye and to vertex, surface shining, very finely, rather closely punctured; vestiture in central area uniformly distributed, some of moderate length, mostly short, almost scalelike, exceedingly long on margins, longest equal in length to four-fifths distance between eves.

Pronotum as in ornatus except usually obscurely to strongly reticulate.

Elytra as in ornatus except punctures usually finer, surface usually very obscurely reticulate; vestiture sparse, usually confined to interstriae 3,8 , and 9 , very short in most specimens as in ornatus.

Male.-Similar to female except much as in male ornatus, but frons much less strongly impressed and without a transverse carina: sparse setae on declivital interstriae 3,8 , and 9 moderately long.

Distribution.- Arizona and New Mexico.
USA: Arizona: Chiricahua Mts.. 5-N. Hubbard and Schwarz. New Mexico: Sacramento Mts., Pinus strohi formis. J. L. Webb; Tortillo Canyon, P. ponderosa. J. L. Webb; White Mts., P. ponderosa, J. L. Webb.

Hosts.- Pinus ponderosa, P. strobiformis.
Notes. - The above treatment was based on the holotypes of infulatus, mollis, and hubbardi, on 2 paratypes of infulatus, on 12 of mollis, and on 14 of hubbardi, and on 3 other specimens.

## 125. Pityophthorus novellus Blackman

Pityophthorus nozellus Blackman. 1928, New York St. Coll. For., Syracuse, Tech. Pul). 25:96 (Holotype, female; Tehachipi, California; U.S. Nat. Mus., 41:301)
Diagnosis.- This species is doubtfully distinct from infulatus Blackman, but it apparently differs by the somewhat more densely punctured female frons, by the smooth, shining prontal disc having the margin of most discal punctures armed by a minute granule, and, apparently, by the slightly more abundant, longer vestiture on the female frons.

Female.- Length $1.9 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown (reared, not fully mature).

As in infulatus except as noted above. In addition, median pair of serrations on anterior margin of pronotum larger (significance
doubtful since some infulatus have some median serrations distincty larger). Declivital setae minute as in female infulatus.

Distribution.-California.
USA: California: Tehachipi, 28-V1-27, Pinus sabiniana, M. W. Blackman.
Notes. - The above treatment was based on the holotype. The male allotype and the female paratype reared with the holotype are of tuberculalus Eichhoff. The type localities of this species and of infulatus and its synonyms, the paucity of other records, and the variability of infulatus suggest that the type specimen of novellus could be no more than a variation of infulatus. Additional material is needed to resolve this problem.

## 126. Pityophthorus pulchellus Eichhoff

Fityophthorus pulchellus Eichhoff. 1869, Berliner Ent. Zeitschr. 12:275 (Holotype, sex?; America septentr.; presumably lost with Hamburg Mus.; Neotype, female: Marquette, Michigan: U.S. Nat. Mus., designated by Bright, 1978, Great Basin Nat. 35:72)
Pityophthorus hirticeps LeConte, 1878, Proc. Amer. Philos. Sox. 17:623 (Lectotype, male; Marquette, Michigan; Mus. Comp. Zool. designated by Bright, 1977, Coleopt. Bull. 30:185): Eichhoff, and Schwarz, 1896, Proc. U.S. Nat. Mus. 18:609. Synonymy
Pityophthorus pusio LeConte, 1875, Proc. Amer. Philos. Soc. 17:623 (Holotype, male: Marquette, Michigan: Mus. Comp. Zool., 1281); Blackman, 1928, New York St. Coll. For., Svracuse, Tech. Pub. 25:111. Synonymy
Diagnosis.- This species is distinguished from tuberculatus Eichhoff by the female frons as described below, by the smooth, shining elytra, and by the coarse elytral punctures.

Female.- Length $1.6-2.2 \mathrm{~mm}, 2.6$ times as long as wide; color very dark brown.

Frons plano-convex except central third plano-concave, central area much as in tuberculatus except with sparse, fine punctures, lateral margins more broadly, more coarsely punctured, marginal setae less than half as abundant, longest setae equal to less than two-thirds distance between eyes.

Pronotum as in tuberculatus except punctures coarser, granules on their lateral margins reduced or absent.

Elytra as in tuberculatus except punctures averaging slightly larger. Surface smooth or with irregular lines, interstrial setae on all
odd-numbered interstriae, extending anteriorly to middle of disc.

Male. - Similar to female except frons about as in tuberculatus except median elevation at upper level of eyes poorly developed to absent.

Distribution.- NE British Columbia and New Brunswick to E Texas and Florida.

CANADA: Alberta: Smith. British Columbia: Chetwynd. Manitoba: Grass River, Menisino, Sandilands. New Brunswick: Big Cove Indian Res., McGraw Brook, Nepisquit. Ontario: Chapleau, Cochrane, Connaught, Constance Bay, Cree Lake, Dryden, Elmira, Ft. William, Gogama, Iroquis Falls, Kakabeka Falls, Kapuskasing, Longlac, Night Hawk Center, Stevens, Tarswell, Timmins, White River. Quebec: Kazabazua. Saskatchewan: Big River, Meadow Lake. USA: District of Columbia: Washington. Florida: Mayport, Punta Gorda, St. Augustine, Trenton. Maine: Brunswick, Orono, Peak Island. Maryland: Beltsville, Silver Springs. Massachusetts: "Massachusetts." Michigan: Marquette. Minnesota: Cloquet. New Jersey: "New Jersey." New York: Massapequa (Long Island). North Carolina: Asheville, Cherokee, Tryon. Pennsylvania: Chambersburg, Charter Oak, Fayetteville, Mt. Carmel. Texas: "Texas." Virginia: Carrsonville, Falls Church, Great Falls. West Virginia: Bladensburg, Cantwell, Hampshire Co., Hancock Co., Mineral Co., Rosslyn. Wisconsin: Lac du Flambeau.

Hosts.- Pinus banksiana, P. palustris, P. resinosa, $P$. rigida, $P$. strobus, $P$. virginiana.

Brology. - Apparently as in tuberculatus.
Notes. - The above treatment was based on the neotype of pulchellus, on the syntypes of hirticeps, on the holotype of pusio, and on 221 other specimens.

Although the principal hosts, Pinus contorta (tuberculatus) and P. banksiana (pulchellus), hybridize in Alberta, the intergradation between these species is almost nonexistent over most of their ranges. One series from 5 miles E Chetwynd, British Columbia, is much more like pulchellus than tuberculatus, but, except for it, I see no reason for reducing them to subspecies of one another. In view of their extensive distributions, the frequency of reference to them in the literature, and the virtual absence of intergradation, they are both retained as valid species.

## 127. Pityophthorus tuberculatus Eichhoff

Pityophthorus tuberculutus Eichhoff, 1878, Mém. Soc. Roy. Sci. Liége (2) $8: 498$ (Stettiner Ent. Zeit. 39:388) (Syntypes?: California: lost with Hanburg Mus.; Neotype, female; Black IIills, South Dakota; U.S. Nat. Mus., designated by Bright, 1978, Great Basin Nat. 38:72)

Pityophthorus rugicollis Swaine, 1925, Canadian Ent. 57:193 (Holotype, female; Glen Alpine, Califoruia; Canadian Nat. Coll.); Bright, 1971, Pan Paeific Ent. 47:67. Synonymy
Pityophthorus tuberculatus var. australis Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:94 (no status in nomenclature)
Deagnosis.- This species is distinguished from pulchellus Eichhoff by the distinctive female frons, by the usually reticulate elytra, and by the smaller elytral punctures.

Female.- Length $1.7-2.4 \mathrm{~mm}, 2.6$ times as long as wide; color very dark brown.

Frons plano-convex from eye to eye from epistoma to vertex, central area mirror smooth, brightly shining, impunctate, often with a few very small punctures near margins, margin abruptly angulate, with a dense, confused marginal band of small setiferous punctures; vestiture confined to margins, very long, longest setae about equal to distance between eyes.

Pronotum 1.1 times as long as wide; widest at base, sides almost straight and subparallel on basal half, rather narrowly rounded in front; anterior margin armed by six serrations, median ones conspicuously larger; posterior areas smooth, shining, punctures moderately small, most of those on dise with a small granule on lateral margin; median line broadly impunctate. Vestiture fine, short.

Elytra 1.7 times as long as wide, 1.7 times as long as pronotum; sides straight and parallel on basal two-thirds, rather narrowly rounded behind; striae not impressed except 1 slightly near declivity, punctures rather small, close, moderately deep, in rows except often slightly confused on basal third; interstriae slightly more than twice as wide as striae, odd-numbered interstriae usually with several small punctures, even-numbered more sparsely punctured, surface shining, usually partly to entirely reticulate. Declivity steep, broadly, moderately sulcate; striae 1 and 2 obsolete, sometimes indicated by minute granules; interstriae 1 distinctly elevated, armed by about 12 fine granules, 2 two and one-half times as wide as 1 , moderately, broadly sulcate, brightly shining, impunctate, 3 very slightly higher than 1, rounded, armed by about 6 small tubercles. Vestiture restricted to sides and to interstrial bristles arising
from granules on declivital interstriae 1 and 3.

Male.-Similar to female except frons convex above, moderately, transversely impressed on lower half, surface smooth, shining, subglabrous, with a short, transverse elevation at upper level of eyes (appearing as a short carina in some specimens, more nearly longitudinal in others).

Distribution.-Alaska and Alberta to Baja California and Coahuila.

ALASKA: Juneau, Skagway. CANADA: Alberta: Burmis, Lake Louise, Nantan, Robb. British Columbia: Copper Mt., Creston, Mt. Benson on Vancouver Isl., Terrace. USA: Arizona, California, Colorado, Idaho, Montana, Nebraska ( 40 km W Halsey), Nevada, New Mexico, Oregon, South Dakota (Black Hills, Custer, Hill City), W Texas, Utah, Washington, Wyoming. MEXICO: Baja California: Laguna Hanson. Durango: Ciudad Madero. Nuevo León: San Roberto. Coahuila: 45 km SE Saltillo.

Hosts.- Pinus aristata, P. attenuata, $P$. cembroides, P. contorta, P. coulteri, P. edulis, P. flexilis, P. jeffreyi, P. monophylla, P. ponderosa, $P$. sabiniana, $P$. strobiformis, rare in Picea engelmannii, P. pungens.

Biology.- This is one of the most abundant scolytid species in pine in western North America. It breeds in slash, supressed seedlings, broken branches, etc., mostly in material from about $2-10 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the neotype of tuberculatus, the holotype of rugicollis, and on 2526 other specimens.

Although minor variations occur throughout the distribution, none of them appear to have taxonomic significance.

## 128. Pityophthorus pseudotsugae Swaine

Pityophthorus pseudotsugae Swaine, 1918, Dom. Canada Dept. Agric. Ent. Br. Tech. Bull. 14(2):99 (Holotype, female; BX Mountain, Vernon District, British Columbia; Canadian Nat. Coll., 1373)
Pityophthorus thatcheri Bright, 1976, Great Basin Nat. 36:442 (Holotype, female; Big Sandy Meadow, S28 T5S R22E, California, Wood Coll.); Wood, 1977, Great Basin Nat. 37:516. Synonymy
Diagnosis.- This species is distinguished by the small, slender body form, by the reti-
culate elytral surface with impunctate interstriae, and by the frons as described below.

Female.- Length $1.6-2.0 \mathrm{~mm}, 3.1$ times as long as wide; color very dark brown.

Frons broadly, subcircularly plano-convex, more than a third of flattened area above upper level of eyes; surface smooth, shining, punctures almost uniformly distributed, moderately fine, not close, spaced by about one to three diameters of a puncture except a dense row on margin; vestiture rather sparse and moderately long in central area, a rather dense row of very long setae on lateral and dorsal margins, longest setae equal to threefifths distance between eyes.

Pronotum 1.13 times as long as wide; widest near base, sides on basal half almost straight, subparallel, converging very slightly, rather broadly rounded in front; anterior margin armed by $8-10$ rather coarse serrations, descending in size laterally; summit at middle, distinctly elevated; posterior areas subshining, obscurely reticulate, punctures of moderate size, rather close, spaced by one to three diameters of a puncture. Glabrous except at margins and on asperate area.

Elytra 1.8 times as long as wide, 1.6 times as long as pronotum; sides almost straight and parallel on basal two-thirds, rather broadly rounded behind; striae not impressed except $l$ (usually) near declivity, punctures rather small, spaced by about two to three diameters of a puncture; interstriae weakly to strongly reticulate, two to three times as wide as striae, impunctate. Declivity steep, moderately bisulcate; striae 1 obsolete, 2 usually obsolete on middle third, minute punctures often present on upper and lower thirds; interstriae reticulate, 1 distinctly elevated and armed by a row of about 10 fine granules, 2 almost three times as wide as 1 , moderately, broadly sulcate, 3 slightly higher than 1 , rather broadly rounded, armed by about 5 moderately coarse granules. Vestiture largely confined to declivity, consisting of minute to short strial and interstrial hair, declivital interstriae 3 with granules bearing a row of long, moderately coarse setae.

Male.-Similar to female except frons with a conspicuous transverse carina on median half at upper level of eyes, convex
above, shallowly, transversely impressed below carina, surface almost smooth, coarsely, closely punctured except punctures slightly smaller in impressed area, subglabrous; serrations on anterior margin of pronotum and tubercles on elytral declivity distinctly larger.

Distribution.- British Columbia and Montana to California and Colorado.

CANADA: British Columbia: Nicomin Ridge, Terrace, Vernon. USA: California: Alameda Co., Big Sandy Meadows, Biggy Meadows, Del Norte Co., Denning Canyon in Napa Co., El Dorado Co., Fallen Leaf Lake, Hat Creek, Humboldt Co., Inyo Co., Kern Co., Lassen N.P., Loyalton, Madera Co., Marin Co., Mariposa Co., Mit. Raymond Trail, Mt. Shasta, Nelder's Grove, Nevada Falls, Northfork, Plumas N.P., Onion Valley, Porcupine Flat, Pyramid R.S., Riverside Co., San Bemardino Co., San Francisco, Shasta Co., Sierra Co., Siskiyou Co., Swarthout Valley, Yosemite N.P. Colorado: Aspen, Cochatopa N.F., Rabbit Ears Pass. Idaho: Big Creek in Potlatch Co., Coeur d'Alene, Lowell, Moscow Mt. Montana: Columbia Falls. Nevada: Kyle Canyon near Las Vegas. Oregon: Hood River, Klamath Co., Suttle Lake, Umgosh N.F. Utah: Alta, Beaver, Brighton, Logan Canyon, Mt. Logan, Mirror Lake, Park City, Wolf Creek Pass. Washington: Metaline Falls, Mt. Rainier.

Host.-Abies concolor, A. grandis, A. lasiocarpa, A. magnifica, Picea cngelmannii, Pinus lambertiana, Pseudotsuga menziesii, Tsuga heterophylla.

Biology.- This species breeds in twigs, small branches, and seedlings.

Notes.- The above treatment was based on the holotype and on 504 other specimens.

## 129. Pityophthorus furnissi Bright

Pityophthorus furnissi Bright, 1976, Great Basin Nat. 36:433 (Holotype, female, Amecameca, Mexico, Mexico; U.S. Nat. Mus.)
Diagnosis.- This species is distinguished from montivagus Bright by the very different declivity and female frons as described below.

Female.- Length $1.9-2.3 \mathrm{~mm}$, about 2.9 times as long as wide; color dark brown.

Frons very similar to brevisetosus Bright except weakly convex only near median line on lower third, somewhat impressed near marginal areas above, punctures slightly larger; vestiture about as in brecisctosus.

Pronotum and elytra as in brevisetosus except declivity more narrowly, less strongly sulcate, more nearly resembling montivagus, granules on lateral convexities small, not always in rows, vestiture rather abundant (slightly more so than in brecisetosus).

Male.-Similar to female except frons about as in male montivagus, with punctures slightly coarser.

Distribution.- Mexico.
MESICO: Mexico: Amecameca, 17-III-54, Pinus hartwegii, R. L. Furniss.

Notes.- The above treatment was based on the type series of 11 specimens.

## 130. Pityophthorus montivagus Bright

Pityophthorus moutizagus Bright, 1977, Canadian Ent. 109:527 (Holotype, female; Km 77 on Highway 175 about 85 km or 53 miles N Oaxaca, Oaxaea, Mexico: Canadian Nat. Coll.)
Diagnosis.- This species is distinguished by the unique male declivity and by the equally mique female frons as described below.

Female.- Length 1.9-2.3 mm, 2.9 times as long as wide; color very dark brown.

Frons rather strongly, biconcavely impressed from epistoma to slightly above eyes, median line rounded and longitudinally concave, upper margin rather abrupt; surface smooth, shining, a few fine punctures in marginal areas; vestiture confined to extreme lateral margin of concavities on lower half, consisting of a small tuft of short yellow hair, each hair pointed mesad.

Pronotum and elytral disc as in pseudotsugae Swaine except surfaces smooth, shining, with numerous impressed points. Elytral declivity similar to pseudotsugae except sulcus much narrower, interstriae 2 ascending laterally, tubercles on lateral summit not as high, not in a row.

Male.-Similar to female except frons transversely impressed from epistoma to slightly above eyes, rather coarsely punctured in lateral areas and above, transverse carina abrupt, not strongly elevated, vestiture inconspicuous; elytral declivity with sulcus deeper, much narrower on middle third.

Distribution.- Oaxaca.
MEXICO: Oaxaca: 37 miles or 60 km S Valle Nacional, 24-N-71. 2800 m . Pinus and P. ayacauite, D. E. Bright; 85 km N Oaxaca on Highway 175, 22-V-69, $P$. patula, J. E. II. Martin.

Notes.- The above treatment was based on the type series of 213 specimens.

## 131. Pityophthorus brevicomatus Bright

Pityophthorus brevicomatus Bright, 1976, Great Basin Nat. 36: 4.30 (Holotype, female: Cerro Potosí. Nuevo León, Mexico; Canadian Nat. Coll.)

Diagnosis.- This species is distinguished from nitidulus (Mannerheim) by the different female frons as described below, by the less strongly impressed declivity, and by the more abundant elytral setae.

Female.- Length 1.9-2.1 mm, 2.9 times as long as wide; color dark brown.

Frons moderately convex; surface finely, very closely punctured; vestiture of abundant, short hair, longest setae near center, equal in length to less than one-sixth distance between eyes.

Pronotum and elytra essentially as in nitidulus except declivital suture as high as lateral convexities, interstriae 2 narrower, not ascending laterally, strial and interstrial setae on declivity much more abundant.

Male- - Similar to female except frons with a moderate, transverse cariua at upper level of eyes and a weak median carina below, surface shining, rather coarsely punctured, vestiture sparse, inconspicuous; declivity similar to, except slightly more strongly impressed than, female.

Distribution.- Nuevo León.
MexiCo: Nuevo León: Cerro Potosí, 4-V-71, Pimus stroliformis, D. E. Bright.

Notes.- The above treatment was based on the type series of 13 specimens.

## 132. Pityophthorus occidentalis Blackman

Pityophthorus orcidentalis Blackman, 1920, Psyche 27:4 (Lectotype, mate; Pitkin, Colorado: U.S. Nat Mus., designated by Bright, 1976, Coleopt. Bull. 30: 18.3 )
Diagnosis. - This species is a geographical replacement of nitidulus (Mannerheim), from which it is distinguished by the absence of long setae on the female declivity and by the much shorter, more confused declivital setae in the mate, by the less strongly sulcate male declivity, and by the much more nearly obsolete punctures on female declivital striae 2.

Female.- Length 1.9-2.4 mm, 2.8 times as long as wide; color dark reddish brown.

As in nitidulus except frontal punctures minute, discal strial punctures averaging slightly smaller, declivital sulcus not as deep, punctures on striae 2 mostly obsolete, granules on interstriae 3 smaller, vestiture minute, interstrial setae on declivity not longer than those of striae, longest setae equal to less than half width of an interstriae.

Male.- Similar to male of nitidulus except declivity slightly less strongly sulcate, slightly fewer tubercles on inner margin of lateral convexity, setae more confused, usually slightly shorter.

Distribution.- SW Wyoming, SE Utah, Colorado, and New Mexico.

USA: Colorado: Clyde, Colorado Springs, Del Norte, Gould, La Veta Pass, Montezuma N.F., Newcastle, Norwood, Pingree Park, Pitkin. New Mexico: Capitan Mts. Sandia Mountains, Santa Fe Ski Basin. Sierra Blanca Mt. Utah: La Sal Mts., Monticello. W yoming: Saratoga.

Hosts.- Picea engelmannii, P. pungens.
Biology.- This species breeds in the tops and limbs of the host.

Notes.- The above treatment was based on Blackman's syntypes in the U.S. National Museum and on 246 other specimens.

## 133. Pityophthorus nitidulus (Mannerheim)

Bostrichus nitidulus Mannerheim, 1843. Moskov. Obshch. Isp. Prirody; Otd. Biol. Biul. (Bull. Soc. Imp. Nat. Noscow) 16:298 (Lectotype, femate, Sitka, Alaska; Helsinki Mus., designated by Bright, 1977, Coleopt. BuIl. 30:186)
Cryphahus atratulus LeConte, 1868, Trans. Amer. Ent. Soc. 2:156 (Lectotype, male; Cabo de los Reyes, California; Mus. Comp. Zool., designated by Bright, 1977. Coleopt. Bull. 30:185); LeConte, 1876, Proc. Amer. Philos. Soc. 15:354. Synonymy
Cryphalus puncticollis LeConte, 1874. Trans. Amer. Ent. Soc. 5:71 (Lectotype, female; Calaveras, California: Mus. Comp. Zool., designated by Bright, 1977, Coleopt. Bull. 30:185); Blackman, 192S, New York St. Coll. For., Syracuse, Tech. Pub. 25:109. Synonymy
Diagnosis.- This species is distinguished by the row of tubercles on interstriae 3, extending from base of declivity along inner margin of lateral crest to middle of declivity, and by the distinctive female frons described below.

Female.- Length $1.8-2.6 \mathrm{~mm}, 2.8$ times as long as wide; color very dark reddish brown.

Frons essentially as in pseudotsugae Swaine except punctures in central area small to very minute, usually less abundant, setae in central area strongly curved on their basal half, usually less abundant.

Pronotum about as in pseudotsugae except surface of posterior areas usually reticulate only in California specimens, those from other areas shining and with impressed points; punctures usually larger.

Elytra outline as in pseudotsugae; striae not impressed except 1 near declivity,
punctures varying from rather small to moderately coarse, close; interstriae about two to three times as wide as striae, usually smooth (occasionally reticulate, particularly in males), sparsely punctured to impunctate (geographically variable). Declivity about as in pscudotsugae except slightly narrower and deeper, lateral convexities conspicuously higher than suture, suture usually unarmed (variable). Vestiture about as in pscudotsugae except strial setae more nearly absent, long interstrial setae on base and sides of declivity as well as on interstriae 3 , setae equal in length to one to two times width of an interstriae.

Male.-Similar to female except frons with a transverse carina at upper level of eyes and a weaker median carina on lower half, surface smooth, shining, coarsely punctured, vestiture sparse, inconspicuous; serrations on anterior margin of pronotum larger; declivity much more deeply sulcate, mesal face of lateral convexities very steep, inner margin armed by a row of denticles from interstriae 2 at base of declivity to middle of declivity, very near but distinct from tubercles on interstriae 3 , vestiture on declivity more abundant, confused, slightly coarser.

Distribution.-Alaska and California to SW Utah and Wyoming.

ALASKA: Kenai, Matanuska, Nenana, Seward, Sitka. CANADA: Alberta: Banff, Highwood Pass. British Columbia: Massett, Hope Trail, Queen Charlotte Islands, Trinity Valley. USA: Arizona: Hannagan Camp in Greenlee Co., Pineleno Mts., San Francisco Mts. California: Alameda Co., Berkeley, Carmel, Del Norte Co. Echo Lake, El Dorado Co., Eureka, Humboldt Co., Inverness, Lake Arrowhead, Los Angeles Co., Los Gatos in Santa Clara Co., Marin Co., Mariposa Grove, Mendocino Co., Mokel Hill, Monterey Co., Oakland, Pacific Grove, Palo Alto, Placer Co., Richmond. San Francisco. San Luis Obispo, Siskiyou Co., Sonoma Co., Tulare Co., Tuolumne Co. Idaho: Franklin Co. Nevada: Baker. Oregon: Albany, Astoria, Bear Spring on Wapinita Cutoff, Bly, Branden, Cascade Head, Mt. Hood, Newport, Portland, Push, Sand Lake, Seaside, Woods. Utah: Beaver, Escalante, Logan Canyon, Mirror Lake, Wolf Creek Pass. Washington: Hoquiam, Nahotta, Ocean Park, Sea View. Wyoming: Buffalo.

Hosts.-Picea engelmannii, P. glauca, P. sitchensis, Pinus contorta, P. radiata.

Biology.- This species breeds in the bole and limbs of the host. Almost all records from Pinus are from the Pacific Coast.

Notes.- The above treatment was based on a female of nitidulus in the Helsinki

Museum labeled "type" and bearing the type data, although the original description obviously is composite; on the syntypes of atratulus and puncticollis; and on 908 other specimens.

Most California and some Oregon specimens are from Pinus. They are smaller, have the pronotum reticulate, and the discal interstriae impunctate. That population overlaps the characters of specimens found in Picea in Oregon and northward and may or may not represent a different taxon. It is possible that this material represents a subspecies or even a distinct species, but additional data are needed.

The coastal population in Picea usually has the discal interstriae sparsely punctured. In most inland series from Picea these interstriae are impunctate. It is doubtful that this character is sufficiently distinctive to warrant the recognition of subspecies.

A series in the U.S. National Museum from Metanuska, Alaska, 30-V-72, has a stouter body, a narrower declivital sulcus, with the lateral convexities much thicker than normal, and conspicuously more dense and longer female frontal vestiture than in other series. If future collecting adds additional support, this population could be given taxonomic distinction.

## 134. Pityophthorus viminalis Bright

Pityophthorus viminalis Bright. 1977. Canadian Ent. I09:530 (Holotype, female; Cerro Potosí, Nuevo León, Mexico; Canadian Nat. Coll.)
Diagnosis.- This species is distinguished from cortezi Bright by the smaller size, by the less strongly impressed, slightly wider basal half of the declivity, and by the shorter setae on the female frons.

Female. - Length $2.5-2.7 \mathrm{~mm}, 2.6$ times as long as wide; color very dark brown.

Frons as in corte $\approx i$ except setae not as long, length of longest setae equal to slightly less than half distance between eyes.

Pronotum and elytra as in cortezi except declivity steeper, basal half of sulcus not as deep, slightly wider. Strial setae on disc usually obsolete (conspicuously present to base in cortezi when not abraded).

Male.-Similar to female except frons slightly impressed, a conspicuous transverse carina at upper level of eyes, median carina
very weak (rather strong in most cortezi), punctures coarse, setae inconspicuous; elytral declivity stronger, with lateral convexities slightly higher.

Distribution.- Nuevo León.
Mexico: Nuevo León: Cerro Potosí, +Y-71, 3800 m . Pinus culminicola, D. E. Bright.

Notes.- The above treatment was based on the type series of seven specimens.

## 135. Pityophthorus cortezi Bright

Pityophthorus cortezi Bright, 1977, Canadian Ent. 109:523 (Holotype, female; Ixtaccihuatl-Popocatepetl N.P., Mexico-Puebla, Mexico; Canadian Nat. Coll.)
Diagnosis.- This species is distinguished from nitidulus (Mannerheim) by the much larger size and by the more strongly sulcate elytral declivity.
Female.- Length' 2.4-3.2 mm, 2.8 times as long as wide; color very dark brown.

As in nitidulus except declivital sulcus much deeper and wider, tubercles on interstriae 3 larger; elytral vestiture less abundant.

Male.-Similar to female except frons as in male nitidulus; declivity as in female except lateral margins more strongly elevated.

Distribution. - Mexico to Puebla.
MEXICO: Mexico: Amecameca, 17-111-54, Pinus harturgii. R. L. Furniss. Puebla: Ixta-Popo N.P.. S-V-TI, 4100 m. P. hartuegii, D. E. Bright.

Notes.- The above treatment was based on the type series of 62 specimens and on 2 other specimens.

## 136. Pityophthorus abiegmus Wood

Pityophthorus abiegmus Wood, 1964, Great Basin Nat. 24:67 (Holotype. female; 4 miles W Río Frio. Mexico, Mexico, Wood Coll.)
Diagnosis.- This species is distinguished from nitidulus (Mannerheim) by numerous characters, including those described below.

Female. - Length $2.0-2.4 \mathrm{~mm}, 2.7$ times as long as wide; color very dark brown.

Frons as in nitidulus except punctures rather coarse, close, abundant; vestiture moderately abundant, fine, only slightly longer on margins.

Pronotum similar to nitidulus except anterior margin armed by about 14 serrations, posterior areas with numerous impressed points, punctures rather coarse, deep.

Elytra similar to nitidulus except punctures on the dise slightly larger, deeper,
declivity much more deeply sulcate, lateral convexities much higher and armed by coarser tubercles.

Male- Similar to female except frons as in male nitidulus, serrations on anterior margin of pronotum larger, declivity only slightly more strongly sulcate but armed on interstriae 2 by a row of tubercles from base to slightly above middle.

Distribution.- Mexico and Puebla to Oахаса.

MEXICO: Mexico: 6 km W Río Frío, 14-VII-53, 2900 m. Abies religiosa, S. L. Wood. Oaxaca: 85 km S Valle Nacional, 24-V-71, 3300 m, A. religiosa, D. E. Bright. Puebla: 15 km N Tlaxco, 9-V11-6i, 2900 m , A. religiosa, S. L. Wood.

Host.- Abies religiosa.
Biology. - Specimens were taken from limbs.

Notes.- The above treatment was based on the type series of 12 specimens and on 22 other specimens.

## 137. Pityophthorus immanis Blackman

Pityophthorus immanis Blackman, 192S, New York St. Coll. For., Syracuse, Tech. Pub. 25:98 (Holotype, female; Chiricahua Mits., Arizona; U.S. Nat. Mus., 41302)
Pityophthorus sulcatus Bright, 1977, Canadian Ent. 109:52S (Holotype. female; Mt. Lemon, Pima Co., Arizona; Canadian Nat. Coll.): Wood, 1977. Great Basin Nat. 37:515. Synonymy
$\mathrm{D}_{\text {Iagnosis. - This species }}$ is distinguished from abiegnis Wood by the flatter, more densely punctured female frons, by the smooth pronotum, and by the slightly steeper declivity.

Female.- Length 1.9-2.8 mm, 2.8 times as long as wide; color very dark brown.

Frons as in abiegnis except flatter, punctures much closer, vestiture slightly more abundant.

Pronotum as in abiegnis except posterior areas smooth, with fewer impressed points.

Elytra as in abiegnis except strial punctures smaller, declivity slightly steeper.

Male. - Similar to female except frons about as in male abiegnis.

Distribution.- Arizona and New Mexico.
USA: Arizona: Chiricahua Mts., 10-V. Hubbard and Schwarz; Rustler's Park, Chiricahua Mits., 7-V1-69, 2700 m, No. 80, Pinus strobiformis, S. L. Wood; Bear Wallow, Santa Catalina Mits., II-V1-69, 2600 m , No. 92, P. strobiformis, S. L. Wood; Hannagan Camp in Greenlee Co., 12-V1I-68, P. strobiformis, D. E. Bright; Mit. Lemon, 5-VIll-fis, P. strobiformis, D. E. Bright. New Mexieo:

Capitan, Hopk. 3953, "P. strobus," W. F. Fiske. A paratype is labeled "Hopk. US 5489, bred Feb. 1900, J. L. Webb coll." MEXICO: Chihuahua: Basaseachi; Cusarara, San Juanito.

Host.- Pinus strobiformis, P. Iumholzii.
Notes. - The above treatment was based on the holotype and on 7 paratypes of immanis (one paratype from Flagstaff, Arizona, is apparently a small female of crassus Blackman), and on the type series of 86 specimens of sulcatus.

## 138. Pityophthorus discretus Wood

Pityophthorus discretus Wood, 1977, Great Basin Nat. 37:394 (Ifolotype, female: 3 miles or 5 km W El Salto, Durango, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from perotei Blackman by the larger average size, by the reticulate pronotum that lacks tubercles on the dise, by the more coarsely punctured frons, and by the steeper, more broadly sulcate declivity.

Female.- Length $1.6-2.2 \mathrm{~mm}, 2.9$ times as long as wide.

Frons plano-convex as in perotei except more coarsely punctured, vestiture shorter (almost two-thirds as long).

Pronotum about as in perotei except posterior areas rather strongly reticulate, punctures moderately coarse, deep (tubercles absent).

Elytra about as in perotei except disc less shining, almost subreticulate in some specimens; declivity slightly steeper, sulcus slightly wider and deeper.

Male.- Similar to female except frontal vestiture shorter and apparently less abundant.

Distribution.- Durango to Jalisco and Puebla.

MEXICO: Durango: 5 km W El Salto, 7-VI-65, 2500 m, No. 33, Pinus ayacuhuite. S. L. Wood. Jalisco: 9 km E Volcán Parícutin, 19-VI-65. 2500 m , Pinus, S. L. Wood. Michoacán: 29 km W' Quiroga, 17-V1-65, 2300 m . No. 70. Pinus, S. L. Wood. Puebla: 25 km W Texmelucan, I4-VII-53, 2800 m , Pinus, S. L. Wood.

Notes. - The above treatment was based on the type series of seven specimens.

## 139. Pityophthorus perotei Blackman

Diagnosis.- This species is distinguished by the fine granules on the pronotal dise that replace the punctures, by the very strongly acuminate elytral apex and shallow declivity, and by the distinctive frons in both sexes.

Female. - Length $1.5-1.9 \mathrm{~mm}, 2.9$ times as long as wide; color dark brown, elytral disc usually pale.

Frons flat to plano-convex on a comparatively small area to a point moderately above eyes, lateral margins rounded to obtusely subangulate; surface shining, closely, uniformly, rather coarsely punctured, interspaces averaging less than half diameter of a puncture: vestiture rather fine, of moderate abundance, rather long on margins, distinctly shorter in central area, longest setae about equal in length to half distance between eyes.

Pronotum 1.0 times as long as wide; outline about as in watsoni Schedl, summit more conspicuous, asperities larger, anterior margin armed by 12 serrations; posterior area shining, weakly reticulate, finely punctured in lateral areas, punctures on disc replaced by transversely elongate granules. Vestiture short, almost obsolete in posterior areas, slightly longer on sides and asperate area.

Elytra 1.7 times as long as wide, 1.7 times as long as pronotum; sides straight and parallel on basal half, then converging slightly to declivity base, very strongly acuminate behind; striae not impressed except 1 near declivity, punctures in rows, rather coarse, shallow; interstriae almost smooth, shining, impunctate, slightly wider than striae. Declivity rather steep, moderately bisulcate; striae 1 obsolete, 2 with very fine, shallow punctures; interstriae 1 moderately elevated, armed by a row of moderately coarse tubercles, 2 moderately impressed, smooth, shining, impunctate, twice as wide as 1,3 , rather broadly convex, as high as $l$, with tubercles as on 1 . Vestiture of fine, very short strial hair often extending to base, and moderately long hair on odd-numbered interstriae on and near declivity.

Male.-Similar to female except frons more finely, less densely punctured, vestiture much less abundant but only slightly shorter; declivital sulcus slightly deeper, apex only moderately acuminate.

Distribution.- Veracruz.

MEXICO: Veracruz: Perote, 9-11-36, Pinus tcocote, D. DeLeon: Las Vigas, 5-V11-67, No. 156, Pinus, S. L. Wood.

Host.- Pinus teocote.
Biology. - Specimens were taken from broken branches.

Notes.- The above treatment was based on the holotype and on 13 other specimens.

## 140. Pityophthorus chalcoensis Hopkins

Pityophthorus chalcocnsis Hopkins, 1905, preprint of Proc. Ent. Soc. Washington 7:73 (Holotype, female; Chalco, Mexico; U.S. Nat. Mus., 7511 )
Pityophthorus herrarai Hopkins, 1905, preprint of Proc. Ent. Soc. Washington 7:7 (Syntypes: A. L. Herrara number 696, Mexico; U.S. Nat. Mus., 7512 ); Bright. 197\%, Great Basin Nat. 35:71. Synonymy
Diagnosis.- This species is distinguished from the somewhat remotely allied scabridus Schedl by the more slender form, by the much more coarsely punctured female frons, and by the declivity.
Female.- Length 2.4-2.5 mm, 2.7 times as long as wide; color yellowish brown.

Frons with basic contours about as in scabridus except punctures coarse (about twice as large), close, vestiture slightly less abundant, with marginal setae slightly longer.

Pronotum 1.1 times as long as wide; sides on basal half almost straight and parallel, broadly rounded behind, anterior margin armed by 12 low serrations; posterior areas smooth, shining, with numerous impressed points, punctures rather coarse, deep, close. Vestiture of fine, moderately abundant, rather long hair except on disc, apparently abraded.

Elytra 1.6 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal two-thirds, broadly rounded behind except very obtusely subangulate at suture; striae not impressed except 1 near declivity, punctures moderately coarse, deep, in slightly irregular rows; interstriae one and one-half times as wide as striae, all with a few punctures equal in size to those of striae. Declivity steeper than scabridus and more strongly sulcate; striae 1 and 2 distinctly punctured to apex; interstriae 1 moderately elevated, armed by a row of rather coarse tubercles, 2 twice as wide as 1 , strongly sulcate, smooth below, minutely etched above, 3 rather abruptly elevated, slightly higher than 1 , armed by about eight tubercles similar to
those on 1 (basically similar to scabridus but declivity steeper, sulcus deeper). Strial setae slightly longer than normal; setae on all interstriae on posterior half of disc and on declivity except 2 . of moderate length, not longer on declivity.

Distribution.- Michoacán to Mexico.
MEXICO: Mexico: Chalco, Utl., 19-X-03, con 872, Herrera. Michoacán: Rancho San Jeronimo at Hidalgo, 29-1-61. tronco de Pinus.

Notes. - The above treatment was based on the holotypes of chalcoensis and herrarai and on four other specimens. Hopkins listed "Chaleo" as the type locality of chalcoensis, but the label on the type clearly reads "Chalco."

## 141. Pityophthorus miniatus Bright

Pityophthorus miniatus Bright, 1981, Ent. Soc. Canada Mem. 115:250 Holotype, female; Cerro Peña Blanca, Honduras: Wood Coll.)
Diagnosis.- This species is distinguished from ingens Blackman by the smaller size, by the plano-convex frons, with its surface sometimes falsely appearing granular, and by the slightly narrower sulcus on the lower half of the declivity. This species and ingens have the male frons sculptured as in the female and almost equally pubescent.

Female. - Length 2.1-2.6 mm, 2.9 times as long as wide; color dark reddish brown.

Frons plano-convex, shining, densely, finely, uniformly punctured almost from eye to eye; a very weak epistomal process indicated; vestiture as in ingens except with fewer long setae on lateral and dorsal margins.

Pronotum essentially as in pullus (Zimmermann) and ingens except pubescence confined to marginal areas.

Elytra as in ingens except declivital sulcus slightly less strongly impressed; declivital interstriae 2 about one and one-half times as wide as 1 ; sparse elytral setae slightly longer and more abundant than in ingens.

Male.-Similar to female except frontal vestiture less abundant and shorter.
Distribution.- Oaxaca to Honduras.
MexiCO: Oaxaca: 184 km S Oaxaca on Highway 131. Pinus lausoni, D. E. Bright. GUATEMALA: Godinez, 29-1V-56, Pinus pscudostrohus, R. L. Furniss. HONDURAS: Cerro Peña Blanca, 23-IV-64, 1300 m . No. 525. P. p.seudostrobus, S. L. Wood: Tegucigalpa, 9-111-66, P. oocarpa. NICARAGUA: Darrili-Esteli, 12-1-60, pine bark.

Biology.- Specimens were taken from a bole 1 m in diameter 1.5 m above ground.

Notes.- The above treatment was based on the type series of seven specimens.

## 142. Pityophthorus ingens Blackman

Pityophthorus ingens Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pul). 25:124 (Holotype, female; Santa Catalina Mountains, Arizona: U.S. Nat. Mus., 41315)

Diagnosis.- This species is distinguished from miniatus Bright by the larger size, by the slightly impressed to partly concave female frons, with its surface less nearly granular, and by the slightly wider sulcus on the lower half of the declivity.

Female.- Length 2.3-3.2 mm, 3.0 times as long as wide; color dark reddish brown.

Frons weakly concave from epistoma to upper level of eyes; surface shining, densely, uniformly, finely punctured almost from eye to eye from epistoma to vertex, spaced by less than half diameter of a puncture; vestiture very fine, uniformly distributed, rather short in central area, much longer on lateral and dorsal margins.

Pronotum as in pullus (Zimmermann).
Elytra 1.9 times as long as wide, 1.7 times as long as pronotum; sides almost straight and parallel on basal two-thirds, obtusely subacuminate behind; striae not impressed, punctures weakly to moderately confused, interstrial punctures rather sparse, usually confused with those of striae. Declivity steep, bisulcate; punctures on striae 1 and 2 very small but distinct to near apex; interstriae 1 moderately elevated and armed by a row of fine tubercles, 2 rather strongly, broadly impressed, slightly more than twice as wide as 1 , smooth, shining, with numerous impressed points, impunctate, 3 as high as 1 , armed by about $8-10$ small tubercles. Vestiture largely confined to declivity, sparse, short, mostly in interstrial rows.

Male. - Similar to female except frons more strongly concave below upper level of eyes, frontal pubescence finer, shorter, slightly less abundant (general sculpture, punctures, and pubescence as in female).

Distribution.-S Arizona to Durango.
USA: Arizona: Chiricahua Mts., Graham Mts., Santa Catalina Mts. MEXICO: Chihuahua: San Juanito, 15-III-74, Pinus, M. M. Furniss. Durango: 24-111-74. M. M. Furniss.

Host.- Pinus ponderosa.
Notes.- The above treatment was based on the holotype and on 21 other specimens.

## 143. Pityophthorus confusus Blandford

Pityophthorus confusus Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):237 (Lectotype, female; San Gerónimo, Guatemala; British Mus. Nat. Hist., designated by Bright, 1976, Coleopt. Bull. 30:184)
Pityophthorus bellus Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:123 (Holotype, female; Monongalia Co., West Virginia; U.S. Nat. Mus., 41314): Wood, 1977, Great Basin Nat. 37:515. Synonymy
Diagnosis.- This species is distinguished from miniatus Bright and ingens Blackman by the very different sculpture of the frons in both sexes.

Female.- Length 1.9-2.4 mm, 3.0 times as long as wide; color dark reddish brown.

Frons similar to confertus Swaine except median two-thirds moderately concave; surface smooth, shining, punctures moderately coarse, spaced by distances averaging one diameter of a puncture; vestiture fine, moderately long and uniformly distributed in central area, very long on lateral and dorsal margins.

Pronotum and elytral disc as in ingens except strial punctures almost always in definite rows. Declivity about as in ingens except interstriae 2 about one and one-half times as wide as 1 , its surface finely, somewhat obscurely reticulate, tubercles on 3 slightly larger.

Male. - Similar to female except frons weakly to strongly concave on central area below upper level of eyes (variable within a series), a feeble transverse carina sometimes weakly indicated at upper margin of impressed area, punctures usually slightly closer, vestiture short, less widely distributed (much less abundant and more restricted than in ingens, but definitely similar).

Distribution.-- Pennsylvania and E Texas to Florida, Durango and Veracruz to NW Nicaragua.

USA: Arkansas: Ashley Co. Florida: Baldwin, Gainesville. Georgia: Athens, Clark Co., Columbus, Putnam Co., Thomasville. Louisiana: Bogalusa. Mississippi: Leaf, Lucidale, Meadville. North Carolina: Asheville, Fletcher, Tryon. Pennsylvania: Mt. Alto. Texas: Call, Hardin Co., Montell. South Carolina: Ceorgetown, Glen Avon, Spartanburg. Virginia: Camp Pickett in Nottoway

Co., Gloucester Co. West Virginia: Back Creek Mit., Dellslow, Hampshire Co., Hardy Co., Kanawha Co., Monongalia Co., Pendleton, Randolph Co., Romney, Wood Co. MEXICO: Chiapas: Lazardo Cardenas, junction of Highway 190 and 195. Durango: El Salto. Jalisco: Guadalajara. GUATEMALA: San Geronimo. HONDURAS: San Lucas and Yuscaran (Paraiso). NICARAGUA: Segovia.

Hosts.-Pinus echinata, P. oocarpa, P. taeda.

Brology.- Specimens taken in Honduras bred in boles $10-25 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the lectotype of confusus, on the holotype and allotype of bellus, and on 306 U.S. and 62 other specimens from Mexico, Guatemala, and Honduras.

## 144. Pityophthorus annectens LeConte

 Fig. 207Pityophthorus amectens LeConte, 1878, Proc. Amer. Philos. Soc. 17:622 (Lectotype, female: Tampa, Florida; Mus. Comp. Zool., designated by Bright, 1976, Coleopt. Bull. 30:185)
Pityophthorus citus Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:137 (Holotype, female; Chiricahua Mts., Arizona; U.S. Nat. Mus., 41322); Wood, 1977. Great Basin Nat. 37:514. Synonymy
Diagnosis.- This species is distinguished from consimilis LeConte by the more extensively flattened female frons and very long frontal vestiture, by the more strongly impressed male declivity, and by other characters mentioned above.
Female.- Length $1.3-1.7 \mathrm{~mm}, 2.9$ times as long as wide; color yellowish to reddish brown.

Frons broadly flattened from epistoma to vertex, more than half of flattened area above upper level of eyes; surface smooth, shining, uniformly, very finely, very closely punctured; vestiture of abundant hair, of moderate length in central area, very long on margins, longest setae equal to two-thirds distance between eyes.

Pronotum 1.14 times as long as wide; as in consimilis except either minute impressed points or reticulation also present on posterior areas.

Elytra 1.8 times as long as wide, 1.6 times as long as pronotum; outline and disc as in consimilis except surface smoother, shining. Declivity as in consimilis except striae 2 more distinctly punctured, interstriae 2 slightly more strongly impressed.

Male.-Similar to female except frons rather strongly convex, a moderate transverse impression on lower half, surface shining, coarsely punctured, vestiture inconspicuous; declivital sulcus much deeper, tubercles on interstriae 1 and 2 slightly larger.

Distribution.- West Virginia and Virginia to Arizona, British Honduras, and Florida.

USA: Arizona, Alabama, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Texas (eastem), Virginia. West Virginia. MEXICO: Hidalgo, Jalisco, Mexico, (?) Chiapas. BRITISH HONDURAS: Belise.

Hosts.-Pinus caribaea, P. edulis, P. elliotti, P. palustris, P. ponderosa, P. taeda, P. spp.

Biology.- Specimens were taken from branches.

Notes. - The above treatment was based on the lectotype of annectans, on the holotype of citus, and on 148 other specimens.

The female frontal vestiture tends to vary considerably throughout the range within and between series. The number and length of the setae tend to decrease slightly in material from Arizona and Mexico.

The material from Chiapas in southern Mexico is larger (1.7-2.1 mm), has the declivital sulcus deeper, has the strial hair at the base of the declivity twice as long, and has the discal punctures on the male elytra rather strongly confused. In the absence of specimens from the area between Mexico (the state) and Chiapas, an evaluation of the significance of these characters is not possible.

## 145. Pityophthorus cacuminatus Blandford

Pityophthorus cacuminatus Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):237 (Lectotype, female; San Gerónimo, Verapaz, Guatemala; British Mus. Nat. Hist., designated by Bright, 1977, Coleopt. Bull. 30:183-188)
Diagnosis.- This species is distinguished from annectens LeConte by the more coarsely punctured female frons, with the vestiture averaging shorter, less abundant, particularly on the marginal fringe.

Female.- Length $1.5-1.7 \mathrm{~mm}, 3.0$ times as long as wide; color dark reddish brown.

Frons flat from epistoma to vertex, epistoma slightly elevated, lateral margins obtusely angled, about two diameters of a facet
from margin of eye; surface smooth, shining, densely, rather coarsely punctured, interspaces equal in width to less than half diame-
ter of a puncture; vestiture of uniformly distributed, fine, long hair, conspicuously longer toward dorsal margin, longest setae equal in

Fig. 207. Dorsal aspect of adult Scolytidae: 45. Pseudopityophthorus minutissimus; 46, Pseudopityophthorus pruinosus; 47, Pityophthorus annectans; 48, Pityophthorus pullus; 49, Gnathotrichus materiarius; 50, Hylastes tenuis. (After Blackman 1922:pl. 1X.)
length to three-fourths distance between eves.

Pronotum 1.12 times as long as wide; as in annectens.

Elytra 1.8 times as long as wide, 1.6 times as long as pronotum, as in annectens.

Male.- Similar to female except frons moderately, transversely impressed from epistoma to upper level of eves, a transverse carina usually present at upper level of eyes (varying from obscure to conspicuous), surface coarsely, closely punctured, vestiture inconspicuous; declivity slightly steeper, sulcus slightly deeper.

Distribution- Jalisco to Honduras.
MEXICO: Jalisco: Guadalajara. Michoacán: Quiroqa GUATEMALA: San Gerónimo, Verapaz, Champion. HONDURAS: San Lucas in Paraiso, 22-1V-64, 500 m . No. 525. Pinus oocarpa, S. L. Wood; Tegucigalpa, 9-11166. P. oocarpa.

Host.-Pinus oocarpa, P. sp.
Brology.-Specimens were taken from a cut top, 10 cm in diameter, and in branches.

Notes.- The above treatment was based on the lectotype and on 34 other specimens.

## 146. Pityophthorus murrayanae Blackman

Pityophthorus murrayanae' Blackman, 1922, New York St. Coll. For., Syracuse. Tech. Pub. 16:138 Holotype, female; Grand Lake, Colorado; U.S. Nat. Mus.)
Pityophthorus clongatus swaine, 1925, Canadian Ent. 57:194 (Holotype, female: Merritt, Midday Valley, British Cohumbia; Canadian Nat. Coll., 1365); Blackman, 1928. New York St. Coll. For.. Syracuse, Tech. Pub. 25:133. Synonymy
Pityophthorus gracilis Swaine, 1925. Canadian Ent. 57:195 (Holotype, female; Grant Co., Oregon Canadian Nat. Coll., 1364): Wood, 1977, Great Basin Nat. 37:515. Synonymy
Pityophthorus cutleri Swaine, 1925, Canadian Ent. 57:195 (Holotype, female: Merritt, Midday Valley, British Columbia; Canadian Nat. Coll.) Wood, 1977. Great Basin Nat. 37:515. Synonymy
Pityophthorus exilis Swaine, 1925, Canadian Ent. 57:196 (Holotype, female: Ochoco N.F., Oregon; Canadian Nat. Coll., 1362): Wood, 1977, Great Basin Nat. 37:515. Synonymy
Pityophthorus tenuis Swaine. 1925, Canadian Ent. 57:196 (Holotype, female; Merritt, Midday Valley, British Columbia; Canadian Nat. Coll., 1366); Wood, 1957, Canadian Ent. 89:401. Synonymy
Pityophthorus depygis Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:128 (Holotype, female; Clyde, Colorado; U.S. Nat. Mus., 41318); Wood, 1977, Great Basin Nat. 37:515. Synonymy

Pityophthorus uatsoni Schedl, 1930, Canadian Ent. 62:197 Holotype, female: Nictor Lake, New Brunswick; Canadian Nat. Coll., 3167); Wood, 1977, Great Basin Nat. 37:515. Synonymy
Pityophthorus aurulentus Bright, 1966, Pan Pacific Ent. 42:301 Holotype, female; Shell Ridge at Walnut Creek, Contra Costa Co., Califomia: California Acad. Sci.): Wood, 1977, Great Basin Nat. 37:515. Synonymy
Pityophthorus acceptus Bright, 1981. Ent. Soc. Canada Mem. 115:315 (IIolotype, female; Granite Pass. Big Horn Mts.. Wyoming; Canadian Nat. Coll.). Neu synonymy
Diagnosis.- This species is distinguished from consimilis LeConte by the larger size, by the more slender body form, by the wider discal striae, and by the occasional presence of a few interstrial punctures on the disc. The female frons varies radically within and between series.

Female. - Length 1.8-2.4 mm, 2.9-3.1 times as long as wide; color reddish brown.

Frons varying from extensively flattened, with margins abrupt to moderately convex, with margins rounded; varying from uniformly, very finely, densely punctured to uniformly, rather coarsely, closely punctured, shining; varying from glabrous to dense micropile to moderately fine, rather abundant setae of moderate length to abundant and very long, with longest setae at margins; most series of one variant only, others sometimes containing all possible variants and intermediates.

Pronotum 1.1 times as long as wide; sides almost straight and parallel on basal half, broadly rounded in front; anterior margin armed by about 10-14 low serrations; summit at middle, distinct; posterior areas smooth, shining, numerous minute impressed points present, punctures sparse, spaced by 2-4 diameters of a puncture, rather fine, deep. Disc glabrous, sparse setae on lateral margins and in asperate area.

Elytra 1.9 times as long as wide, 1.7 times as long as pronotum; sides almost straight and parallel on basal three-fourths, rather abruptly rounded, then subacuminate at apex; striae in rows, not impressed, punctures moderately coarse, spaced by 1-2 diameters of a puncture; interstriae shining, varying from almost smooth to obscurely subreticulate (impressed lines or points usually indicated), slightly wider than striae, odd-numbered interstriae usually sparsely punctured, punctures almost
as large as those of striae. Declivity steep, moderately bisulcate; striae 1 and 2 minutely punctured to obsolete; interstriae 1 moderately elevated, armed by a sparse row of fine granules, 2 moderately, broadly impressed, twice as wide as 1 , obscurely subreticulate, impunctate, 3 rather narrowly convex, as high or slightly higher than 1 , armed by a few fine granules as on 1. Vestiture of fine short strial hair sometimes extending to base; setae on odd-numbered interstriae on and near declivity varying from absent to short to moderate length.

Male.- Similar to female except frons rather strongly, uniformly convex, often with a moderate, transverse impression below, more coarsely, less closely punctured, vestiture short, inconspicuous; declivital sulcus very slightly deeper.

Distribution.- Alaska and Manitoba to California and Arizona.

ALASKA: Hope, Richardson Highway mile 295. CANADA: British Columbia: Hixon, Merritt in Midday Valley. Manitoba: Winnipeg. New Brunswick: Nictor Lake. Northwest Territories: Aklavik, Reindeer Depot. Ontario: Frater. USA: Arizona: Prescott N.F. California: Shell Ridge at Walnut Creek in Contra Costa Co. Colorado: Clyde, Gould, Grand Lake, Pingree Park, Pitkin. Idaho: Payette N.F., Smith’s Ferry. Montana: Bozeman, Glacier N.P., Sula. Nevada: Bear Creek Summit in Elko Co., Mt. Wheeler. Oregon: East Lake, Grant Co., Ochoco N.F., Pringle Falls near Bend, Blue Mts. Utah: Elk Park in Ashley N.F., Convulsion area in Fishlake N.F., Hoop Lake in Wasatch N.F., Huntington Canyon, Logan Canyon, Sanford Canyon in Dixie N.F., Wolf Creek Pass. Washington: Metaline Falls. Wyoming: Atlantic City, Bighorn Mts., Elk Mt., Frontier Creek in Shoshone N.F., Laramie, Moran in Bridger N.F., Mountain View, Saratoga, Shoshone River, Tensleep.

Hosts.- Picea glauca, P. engelmannii, $P$. pungens, Pinus albicaulis, P. contorta, P. flexilis, P. ponderosa, P. radiata.

Biology.- This species has been taken in branches $1-4 \mathrm{~cm}$ in diameter, but it occurs much more commonly in the bole of small trees up to 20 cm in diameter. Males are rare in most areas.

Notes. - The above treatment was based on the holotypes of murrayanae, elongatus, gracilis, cutleri, exilis, tenuis, depygis, watsoni, and acceptus, on several paratypes of aurulentus, and on more than 2000 other specimens.

The large number of synonyms calls attention to the extreme variability of the female
frons in this species. This variability is somewhat comparable to that seen in carniceps LeConte and allied species and in Ips tridens (Mannerheim). The rarity of males and the variability of the female frons suggests the occurrence of a form of facultative parthenogenesis in at least some of the populations.

## 147. Pityophthorus consimilis LeConte

Pityophthorus consimilis LeConte, 1878, Proc. Amer. Philos. Soc. 17:622 (Lectotype, male; Marquette, Michigan: Mus. Comp. Zool., designated by Bright, 1976, Coleopt. Bull. 30:185)
Pityophthorus granulatus Swaine, 1917, Dom. Canada Dept. Agric. Ent. Br. Tech. Bull. 14(1):28 (Lectotype, male; presumably Manitoba, Quebec, or Nova Scotia; Canadian Nat. Coll., 3149, designated by Bright, 1967, Canadian Ent. 99:678); Blackman, 1928, New York St. Coll. For.. Syracuse, Tech. Pub. 25:132. Synonymy
Pityophthorus nudus Swaine, 1917, Dom. Canada Dept. Agric. Ent. Br. Tech. Bull. 14(I):30 (Lectotype, male; Ste. Anne de Bellvue, Quebec; Canadian Nat. Coll., 3148, designated by Bright, 1967, Canadian Ent. 99:678); Wood, 1977, Great Basin Nat. 37:515. Synonymy
Diagnosls.- This species is distinguished from annectens LeConte by the less extensively flattened female frons with very short to obsolete vestiture and by the less strongly sulcate declivity.

Female.- Length 1.3-1.7 mm, 2.9 times as long as wide; color yellowish to dark reddish brown.

Frons varying from rather strongly, evenly convex, with a weak, transverse impression immediately above epistoma to flattened on lower two-thirds; surface shining, very densely, coarsely, deeply punctured, interspaces equal in width to less than half diameter of a puncture; glabrous to very finely pubescent on lower two-thirds, setae equal in length to less than one-fifth distance between eyes.

Pronotum 1.1 times as long as wide; widest on basal third, sides on basal two-thirds weakly arcuate, converging slightly, rather broadly rounded in front; anterior margin armed by 10-12 low serrations; summit at middle, distinct; posterior areas smooth, shining, punctures rather fine, moderately abundant. Dise glabrous, inconspicuous, short setae on margins and asperate area.

Elytra 1.7 times as long as wide, 1.6 times as long as pronotum; sides almost straight and parallel on basal two-thirds, rather abruptly
rounded at base of declivity, rather strongly acuminate at apex; striae not impressed except 1 slightly near declivity, punctures in rows, moderately coarse, rather deep; interstriae almost smooth to minutely irregular, impunctate, one to one and one-half times as wide as striae. Declivity steep, rather strongly bisulcate; striae 1 obsolete, 2 with minute, widely spaced punctures; interstriae 1 moderately elevated, armed by a sparse row of fine tubercles, 2 moderately impressed, more than twice as wide as 1 , impunctate, almost smooth, 3 rounded, as high as 1 , with fine tubercles as on 1 . Vestiture of sparse, short hair on odd-numbered interstriae on and near declivity, sometimes glabrous.

Male.-Similar to female except transverse impression on lower half of frons usually stronger, sometimes with a transverse median callus at upper level of eyes.

Distribution.- NE British Columbia and Nova Scotia to E Texas and Florida.

CANADA: Alberta, British Columbia ( 158 mi House, Alaska Highway), Manitoba, Nova Scotia, Ontario, Quebec, Saskatchewan. USA: Florida, Georgia, Kentucky, Louisiana, Maine, Massachusetts, Michigan, Minnesota. Mississippi, New Hampshire. New York, North Carolina, Ohio, Virginia, West Virginia, Wisconsin.

Hosts.- Picea glauca, P. sp., Pinus banksiana, P. resinosa, P. rigida, P. strobus, P. viginiana, $P$. spp.

Biology. - They breed in twigs and branches up to 2 cm in diameter.

Notes.- The above treatment was based on the syntypes of consimilis, on the lectotypes of granulatus and nudus, and on 382 other specimens.

## 148. Pityophthorus intentus Bright

Pityophthorus intentus Bright, 1978. Great Basin Nat. 38:77 (Holotype, female; Bear Canyon in Santa Catalina Mts., Arizona; Canadian Nat. Coll.)
Diagnosis.- This species is distinguished from consimilis LeConte by characters of the frons and elytral declivity as described below.

Female.- Length $1.4-1.7 \mathrm{~mm}, 2.7$ times as long as wide; color yellowish brown.

Frons strongly convex above, flattened on lower half of area below upper level of eyes; surface smooth, shining, coarsely punctured; vestiture sparse, short, inconspicuous.

Pronotum and elytra as in consimilis except declivital sulcus slightly deeper, interstriae 1 and 3 each armed by about four
pointed tubercles (much larger than in consimilis), setae on odd-numbered declivital interstriae much longer.

Male. - Similar to female except frons usually with a conspicuous transverse carina at upper level of eyes, impression on lower frons stronger, minute setae on declivity rather stout, much more conspicuous.

Distribution.-Arizona.
USA: Arizona: Bear Canyon in Santa Catalina Mts., 15-V1ll-68, Pinus engelmannii, D. E. Bright; Santa Rita Mts., 29-VIl-68. Pinus strobiformis, Pseudotsuga menziesii, D. E. Bright.
Notes. - The above treatment was based on the type series of 18 specimens.

## 149. Pityophthorus pullus (Zimmermann)

Fig. 207

Cyrpturgus pullus Zimermann, 1868, Trans. Amer. Ent. Soc. 2:143 (Holotype female; South Carolina: Mus. Comp. Zool.); Bright, 1976, Coleopt. Bull. 30:187 (Lectotype?)
Cryphalus pullus: LeConte, 1868. Trans. Amer. Ent. Soc. 2:155
Pityophthorus pullus: LeConte, 1876, Proc. Amer. Philos. Soc. 15:352
Pityophthorus cribripennis Eichhoff, 1869. Berliner Ent. Zeitschr. 12:274 (Holotype, sex?: America septentr.: apparently lost with Hamburg Mus.; Neotype, sex?; Ripley, Mississippi; U.S. Nat. Mus.. designated by Bright, 1978, Great Basin Nat. 38:72): Blackman, 1928, New York St. Coll. For., Syracuse. Tech. Pub. 25:119. Synonymy
Pityophthorus bisulcatus Eichhoff, 1869, Berliner Ent. Zeitschr. 12:274 (Holotype, sex?; America borealis; apparently lost with Hamburg Mus.); LeConte, 1876, Proc. Amer. Philos. Soc. 15:352. Synonymy
Diagnosis.- This species is distinguished from grandis Blackman by the smaller average size, by the more weakly, transversely impressed frons, by the finer frontal sculpture, by the steeper, narrower declivital sulcus, and by the distribution.

Female.- Length 1.8-2.6 mm, 2.9 times as long as wide; color reddish brown.

Frons shallowly, transversely impressed from epistoma to upper level of eyes, a conspicuous transverse carina at upper level of eyes on median half; surface smooth, brightly shining, punctures moderately coarse, rather close; vestiture rather sparse, of moderate length.

Pronotum 1.1 times as long as wide; widest at base, sides on basal half almost straight, converging slightly, broadly rounded in front;
anterior margin armed by about $10-14$ serrations; summit slightly elevated, slightly in front of middle; posterior areas smooth, shining, with numerous impressed points, punctures moderately coarse, rather close. Vestiture short, rather sparse, often absent on discal area.

Elytra 1.7 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal three-fourths, rather abruptly rounded, then obtusely subacuminate at apex; striae not impressed, punctures rather coarse, deep, moderately to rather strongly confused, interstriae not distinguishable on most specimens. Declivity very steep, rather strongly bisulcate; striae 1 and 2 indicated by rows of fine punctures; interstriae 1 moderately elevated, with a few, fine, irregularly spaced granules, 2 almost twice as wide as 1 below, narrower above, rather strongly, broadly impressed, surface indistinctly to strongly reticulate, impunctate, 3 very slightly higher than suture on upper half, rounded, armed by 4-6 fine tubercles. Vestiture rather short on disc, twice as long on declivity, moderately abundant, absent on declivital interstriae 2.

Male.-Similar to female except usually slightly smaller, frontal vestiture shorter, less abundant.

Distribution.- Michigan and New York to E Texas and South Carolina.

USA: District of Columbia: Washington. Maryland: "Md." Massachusetts: "Mass." Michigan: "Michigan." Mississippi: Corinth, Iuka, Ripley. New Jersey: Clemonton. New York: Greenwood Lake. North Carolina: Asheville, Boardman, Chadburn, Durham, Raleigh, Tryon. Pennsylvania: Hunters Run. South Carolina: Columbia. Texas: Call, Kirbyville. West Virginia: Dellslow, Charleston, Doddridge Co., Hampshire Co., Roosevelt, Wood Co.

## Hosts.- Pinus spp.

Notes. - The above treatment was based on a specimen of cribripennis compared to the type by Eggers (Bright's neotype) and on 272 other specimens. The lectotype of pullus was not examined.

## 150. Pityophthorus grandis Blackman

Pityophthorus grandis Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:119 (Holotype, sex?; Kaibab National Forest, Arizona; U.S. Nat. Mus., 41312)
Diagnosis.- This species is distinguished from pullus (Zimmermann) by the slightly
larger average size, by the more strongly impressed, more coarsely sculptured frons, by the more broadly sulcate elytral declivity, and by other characters.

Female.- Length 2.3-3.1 mm, 2.9 times as long as wide; color dark reddish brown.

Frons as in pullus except more strongly impressed, punctures slightly coarser, closer, vestiture less abundant, shorter.

Pronotum as in pullus except anterior margin slightly more narrowly rounded.

Elytra as in pullus except declivital sulcus wider, three times as wide as interstriae 1 near middle, less strongly narrowed above. Vestiture shorter, less abundant on disc.

Male.-Similar to female except frontal carina longer, frontal vestiture shorter, less abundant.

Distribution.- British Columbia and South Dakota to Arizona and New Mexico.

CANADA: British Columbia: Grand Forks, Merritt in Midday Valley. USA: Arizona: Kaibab N.F., Prescott. California: McCloud. Colorado: Colorado N.F., Colorado Springs, Ft. Garland. Nebraska: Norden. New Mexico: Meek, Sandia Mts. South Dakota: Black Hills, Custer. Utah: La Sal Mts., Long Hollow in Dixie N.F. Wyoming: Buckeye.

Host.-Pinus ponderosa.
Biology.- Specimens were taken from shaded out or broken branches and seedlings $3-8 \mathrm{~cm}$ in diameter. It evidently does not occur in slash.

Notes.- The above treatment was based on the holotype and on 409 other specimens.

## 151. Pityophthorus serratus Swaine

Pityophthorus scrratus Swaine, 1918, Dom. Canada Dept. Agric. Ent. Br. Tech. Bull. 14(2):103 (Holotype, male; Barkhouse Creek, Siskiyon Co., California; Canadian Nat. Coll., 1374)
Diagnosis.- This rare species is distinguished from confertus Swaine by the very strongly sulcate declivity, with the suture unarmed and the subacutely elevated lateral convexities armed by about 10 moderately coarse tubercles and considerably higher than the suture.

Female.- Length 2.1-2.2 mm, 3.0 times as long as wide; color reddish brown.

Frons plano-convex almost from eye to eye, from epistoma to vertex, epistomal process obscure or absent; surface smooth, shining, finely, closely, uniformly punctured,
punctures spaced by slightly less than diameter of a puncture; vestiture of fine, long, moderately abundant hair, setae on upper and lateral margins much longer, longest setae equal to more than half distance between eyes.

Pronotum 1.1 times as long as wide; essentially as in confertus.

Elytra 1.9 times as long as wide, 1.7 times as long as elytra; sides almost straight and parallel on basal three-fourths, abruptly rounded, rather narrowly subacuminate behind; striae not impressed, punctures varying from feebly to moderately confused, moderately coarse, rather deep. Declivity steep, very strongly sulcate; punctures on striae 1 and 2 minute, many obscure; interstriae 1 rather weakly, narrowly elevated, unarmed, 2 very broad, ascending on lateral half, four times as wide as 1 , shining, almost smooth, 3 on upper two-thirds very strongly, subacutely elevated; considerably higher than suture, armed by $8-10$ rather coarse tubercles. Vestiture of moderately long strial and interstrial setae from base to declivity, much longer on declivity except minute on interstriae 1 and absent on 2.

Male.- Similar to female except frons transversely impressed, a transverse carina at upper level of eyes, more coarsely punctured, vestiture sparse, inconspicuous; row of setae on crest of declivital elevation shorter and very strongly compressed.

Distribution.- British Columbia and Idaho to N California.

CANADA: British Columbia: Aspen Grove, 16-VIII31, 17360 Lot 50, Pinus ponderosa, H. Richmond; Merritt, Midday Valley, 17-VIII-22, lot 900-1705, P. ponderosa, V. Cutler. USA: California: Barkhouse Creek, Siskiyou Co., No. 2933, P. ponderosa, R. Hopping; McCloud, 27-X-72, sticky trap. H. A. Moeck. Idaho: Viola Grade near Moscow, 23-1V-52, 1000 m , W. F. Barr.

## Host.- Pinus ponderosa.

Notes. - The above treatment was based on the holotype and on nine other specimens.

## 152. Pityophthorus confertus Swaine

Pityophthorus confertus Swaine, 1917, Dom. Canada Dept. Agric. Ent. Br. Tech. Bull. 14(1):27 (Lectotype, female; Adams Lake, British Columbia: Canadian Nat. Coll., 1375, designated by Bright, 1967, Canadian Ent. 99:678)
Pityophthorus aguatus Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:125 (Holotype, female; Cloudcroft, New Mexico; U.S. Nat.

Mus., 41316): Wood, 1977, Great Basin Nat. 37:514. Synonymy
Pityophthorus comptus Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:127 (Holotype, female; Santa Catalina Mts., Arizona; U.S. Nat. Mus., 41317); Wood, 1977, Great Basin Nat. 37:514. Synonymy
Pityophthorus burkei Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:129 (Holotype, female: Meyers, California; U.S. Nat. Mus., 41319): Bright, 1966, Pan Pacific Ent. 42:304. Synonymy
Diagnosis.- This common species is distinguished from serratus Swaine by the stouter body form and by the less strongly sulcate declivity, with interstriae 1 as high as 3 and each armed by about six fine tubercles.

Female.- Length $1.8-2.3 \mathrm{~mm}, 2.8-2.9$ times as long as wide; color very dark brown.

Frons flat to plano-concave, impression confined to central half, epistomal process conspicuous; surface smooth, shining, punctures moderately coarse, almost uniformly distributed, spaced by slightly less than diameter of a puncture; vestiture fine, uniformly distributed, moderately long in central area, much longer on margins.

Pronotum 1.1 times as long as wide; outline as in pullus (Zimmermann) except anterior margin armed by about eight serrations; posterior areas smooth, shining, impressed points obscure to absent; median line impunctate; punctures rather coarse, deep, moderately close. Vestiture inconspicuous, confined to margins.

Elytra 1.7 times as long as wide, 1.6 times as long as pronotum; sides almost straight and parallel on basal two-thirds, obtusely subacuminate behind; discal punctures rather coarse, deep, moderately to very strongly confused. Declivity steep, bisulcate; punctures on striae 1 and 2 minute, mostly distinct; interstriae 1 moderately elevated, armed by a row of about eight fine denticles, 2 broadly, rather strongly impressed, almost smooth, about three times as wide as 1,3 rounded, as high as 1 , armed by about six small tubercles. Vestiture varying from subglabrous to moderately abundant from base to apex; rather short on disc, up to three times as long on declivity.

Male. - Similar to female except frons transversely impressed below a conspicuous, transverse carina at upper level of eyes,
surface coarsely punctured, vestiture sparse, short.

Distribution.- British Columbia and Montana to Baja California and Hidalgo.

CANADA: British Columbia (Creston, Terrace). USA: Arizona, California, Colorado, Idaho, Montana (western), Nevada, New Mexico, Oregon, Texas (western), Utah, Washington, Wyoming MENICO: Baja California, Chihuahua, Hidalgo, Nuevo León.
Hosts.-Pinus albicollis, P. cembroides, $P$. contorta, P. edulis, P. flexilis, P. jeffreyi, $P$. monticola, P. ponderosa, P. strobiformis.

Biology.- This common species infests tops, limbs, and seedlings and is particularly abundant in slash.

Notes.- The above treatment was based on the lectotype of confertus, on the holotypes of agnatus, burkei, and comptus, and on 3088 other specimens.

## 153. Pityophthorus clarus Blackman

Pityophthorus clarus Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pul). 25:130 (Holotype, female; Kaibab N.F., Arizona: U.S. Nat. Mus., 41320)

Diagnosis.- This species is distinguished from murrayanae Blackman by the less slender body, by the rather coarsely punctured declivital striae 1 and 2, by the very different frons, and by other characters.

Female.- Length $1.8-2.1 \mathrm{~mm}, 2.8$ times as long as wide; color reddish brown.

Frons flat to transversely, weakly concave, longitudinally very feebly concave to upper level of eyes, a small, conspicuous, median callus at upper level of eyes, surface smooth, shining, punctures rather coarse, close, uniformly distributed except impunctate on a small median area above epistoma; vestiture very fine, of moderate abundance, rather short in central area of moderate length on margins, longest setae equal in length to onethird distance between eyes.

Pronotum 1.9 times as long as wide; about as in murrayanae.

Elytra 1.7 times as long as wide, 1.5 times as long as pronotum; outline and dise about as in murrayanae except surface smoother. Declivity similar to murrayanae except steeper, striae 1 and 2 rather coarsely punctured, interstriae 2 slightly more strongly impressed.

Male.- Similar to female except frons rather strongly, transversely impressed from
epistoma to upper level of eyes, upper margin transversely subcarinate, surface more coarsely punctured, vestiture short, inconspicuous.

## Distribution.- Arizona.

USA: Arizona: Kaibab N.F., I0-VIII-25, K-II3 and KI14, and 17-VIII-25, K-126, Pinus ponderosa, M. W. Blackman; Flagstaff, Hopk. U.S. 5073a; Prescott, 18-VII30, P. ponderosa, M. W. Blackman.

Ноst.-Pinus ponderosa.
Notes.- The above treatment was based on the holotype, on 64 paratypes, and on 4 other specimens.

## 154. Pityophthorus solatus Wood

Pityophthorus solatus Wood, 1977, Great Basin Nat. 37:215 (Holotype, female; 51 miles or 81 km NW Oaxaca, Oaxaca, Mexico; Canadian Nat. Coll.)
Diagnosis.- This species is distinguished from solers Blackman by the different frons and elytra as described below.

Female.- Length 1.9-2.2 mm, 2.7 times as long as wide; color very dark brown.

Frons similar to solers except planoconvex, punctured pubescent area extending to well above eyes, vestiture slightly more abundant and longer.

Pronotum and elytra as in solers except surface of elytral disc smoother, declivital sulcus slightly wider and deeper, its surface more nearly microreticulate, declivital vestiture distinctly longer.

Male.-Similar to female except frons as in male solers, declivity similar to male solers except sulcus narrower, lateral elevation distinctly higher.

Distribution.- Oaxaca.
MEXICO: Oaxaca: 81 km NW Oaxaca, I0-V-71, 7500 ft., Quereus, D. E. Bright.

Notes.- The above treatment was based on the type series of 14 specimens. The host recorded for the type series appears to be either accidental or in error; all allied species are in coniferous hosts.

## 155. Pityophthorus solers Blackman

Pityophthorus solers Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub). 25:138 (Holotype, female; Cloudcroft, New Mexico; U.S. Nat. Mus., 4132.3)

Diagnosis.- This species is distinguished from clarus Blackman by the darker color, by the minutely punctured declivital striae 1 and 2 , and by the very different frons in both sexes.

Female.- Length 1.5-2.1 mm, 2.7 times as long as wide; color very dark brown.

Frons plano-convex to slightly above eyes, epistomal margin distinctly elevated; surface smooth, shining, punctures rather small, moderately close, slightly more concentrated in marginal areas; vestiture rather sparse, moderately long, of about uniform length.

Pronotum 1.13 times as long as wide; about as in clarus except anterior margin more strongly rounded and discal punctures slightly larger.
Elytra as in clarus except declivity not as steep, declivital striae obsolete, 2 finely punctured.
Male.-Similar to female except frons rather strongly, transversely impressed from epistoma almost to upper level of eyes, a strongly elevated transverse carina at upper level of eyes, surface coarsely punctured, subglabrous; declivity slightly more strongly impressed, tubercles on interstriae 1 and 3 slightly larger.
Distribution.- Utah to Chihuahua.
USA: Arizona: Alpine, Chiricahua Mts., Flagstaff, Graham Mts., Huachuca Mts., Jacob’s Lake, Kaibab N.F., Pinelino Mts., Prescott. Santa Catalina Mts. Walker. New Mexico: Capitan Mts., Cloudcroft, Emory Pass, Meek, Sacramento Mits. Utah: Alta. Mt. Nebo Loop, Parowan Canyon, Payson Canyon, Tooele. MEXICO: Chihuahua: San Juanito. Nuevo León: Cerro Potosí.

Hosts.-Abies concolor, uncommon in A. lasiocara, A. religiosa, Pseudotsuga menziesii, and Pinus.

Biology.- This species breeds in small branches.

Notes.- The above treatment was based on the holotype and on 506 other specimens.

## 156. Pityophthorus bassetti Blackman

Pityophthorus bassetti Blackman, 1920. Psyche 27:1 (Lectotype, male: Pitkin, Colorado: U.S. Nat. Mus., designated by Bright, 1976, Coleopt. Bull. 30:18.3)
Diagnosis.- This species is distinguished from solers Blackman by the very different female frons, by the color, by the unarmed declivital interstriae 1 , and by the much deeper male declivity. Declivital interstriae 3 is much higher than 1 .

Female.- Length $1.8-2.4 \mathrm{~mm}, 2.9$ times as long as wide; color reddish brown.

Frons rather broadly plano-convex to well above eyes, lower fourth ascending toward
epistomal margin; surface smooth, shining, punctures very fine, rather dense, each with upper rim very minutely granulate; vestiture moderately abundant, very long, longest setae equal to slightly more than one-third distance between eyes.

Pronotum and elytral disc essentially as in solers. Declivity about as in murrayanae Blackman except much more strongly impressed, striae 1 and 2 almost obsolete; interstriae l rather weakly to moderately elevated, usually unarmed except for two or three fine granules near apex (occasionally with more granules), 2 very strongly sulcate and three times as wide as 1,3 abruptly, rather strongly elevated, conspicuously higher than 1 , with a row of fine granules. Strial and interstrial setae minute.

Male. - Similar to female except frons strongly impressed from epistoma to upper level of eyes, a strongly elevated, transverse carina at upper level of eyes, surface coarsely punctured, vestiture short, inconspicuous; declivity more strongly impressed, interstriae usually without any granules, 3 with a row of 10-12 rather coarse tubercles, interstrial setae on declivity rather long.

Distribution.- Northwest Territories to Chihuahua.

CANADA: Northwest Territories: Aklavik, 10-V, 5-LN31, O. Bryant. USA: Colorado: Pingree Park in Larimer Co., 14-VI-68, Picea pungens, S. L. Wood; Ft. Garland: 25-IV, Picea; Pitkin, 3-VIII-17, lot 360, R. Bassett. Utah: Logan Canyon, 24-V11-46, P. cugelmannii, S. L. Wood; Mckee Draw in Ashley N.F., 16-VI-60, P. pungens, S. L. Wood. Chihuahua: La Laja, 16-V11-60, Picea chihuahuana, S. L. Wood.

Hosts.- Picea chiluahuana, P. glauca, P. engelmannii, P. pungens.

Biology.- Specimens were taken from shaded-out branches $2-6 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotype and on 269 other specimens.

## 157. Pityophthorus delicatus Wood

Pityophthorus delicatus Wood, 1978, Great Basin Nat. 38:399 (Holotype, female, 35 miles or 56 km SW El Salto, Durango, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from cacuminatus Blandford by the larger size, by the much more finely punctured subconcave female frons, by the sparsely punctured discal interstriae 1 and 3, and by other characters indicated below.

Female.- Length 1.7-2.2 mm, 3.0 times as long as wide; color reddish brown.

Frons broadly, shallowly subconcave from epistomal margin to well above upper level of eyes, margins abrupt, about two diameters of a facet from margin of eye; surface smooth, shining, very finely, somewhat closely punctured, interspaces two or more times diameter of a puncture; vestiture abundant, rather long in central area, conspicuously longer on margins, longest setae equal in length to two-thirds distance between eyes.

Pronotum 1.14 times as long as wide; outline as in allied species; posterior areas shining, subreticulate, punctures fine, those on dise with a fine granule on lateral rim.

Elytra 1.9 times as long as wide, 1.7 times as long as pronotum; outline and disc about as in cacuminatus Blandford except interstriae 1 and 3 with sparse punctures. Declivity steep, moderately bisulcate, moderately acuminate behind; striae 1 and 2 rather finely punctured; interstriae I moderately elevated, armed by a row of fine tubercles, 2 moderately impressed, twice as wide as 1 , smooth, shining, 3 rather narrowly convex, armed as on 1. Vestiture of fine, short, strial hair to base, odd-numbered interstriae on and near declivity with rather sparse, moderately long setae.

Male- Similar to female except frons shallowly, transversely impressed from epistoma to upper level of eyes, upper margin of impressed area with a short, transverse callus or carina, surface rather coarsely punctured, vestiture inconspicuous; declivity more strongly impressed, tubercles distinctly larger.

Distribution.- Chihuahua to Honduras.
Mexico: Chihuahua: La Magdalena, 26-IV-77, Hopk. 60601-D, M. M. Furniss. Durango: 40, 48, and 60 km W Durango, El Salto. Mexico: Apizaco-Mexico km 49. Michoacán: Carapan, Volcán Parícutin. GUATEMala: Huehuetenango, Putzum. honduras: Tegucigalpa.

Hosts.- Pinus leiophylla, P. pseudostrobus, P. tenuifolia, P. spp.

Biology.- Specimens were taken from branches.

Notes.- The above treatment was based on the type series of 46 specimens.

## 158. Pityophthorus arcanus Bright

Pityophthorus arcanus Bright, 1976, Great Basin Nat. 36:429 (Holotype, female; Bear Canyon, Santa Catalina Mts., Arizona; Canadian Nat. Coll.)
Diagnosis.- This species has the pronotal asperities in somewhat subconcentric rows, but because of the abundant female frontal vestiture it is grouped with those having confused asperities. It is distinguished from delicatus Wood by the arrangement of the pronotal asperities, by the flat frons with the punctures slightly larger and much closer, and by the more broadly, more deeply impressed elytral declivity.

Female.- Length $1.7-2.4 \mathrm{~mm}, 2.9$ times as long as wide; color dark reddish brown.

Frons plano-convex from epistoma to slightly above upper level of eyes, surface smooth, shining, densely, rather coarsely punctured, interspaces equal to less than half diameter of a puncture; vestiture rather long, abundant, only slightly longer on margins.

Pronotum and elytral disc about as in jeffreyi Blackman except pronotal asperities slightly less concentric and odd-numbered discal interstriae each with a row of fine punctures. Elytral declivity broadly, rather deeply sulcate; striae 1 and 2 with reduced punctures; interstriae 1 distinctly elevated, with a few small tubercles, 2 three times as wide as 1 , its surface subreticulate, 3 distinctly higher than 1 , its summit armed by three or four small tubercles. Vestiture largely confined to declivity, consisting of sparse, long hair on odd-numbered interstriae.

Male. - Similar to female except frons transversely impressed to upper level of eyes, rather coarsely punctured, an acutely elevated, transverse carina at upper level of eyes.

Distribution.- Nevada to Arizona and W Texas.
USA: Arizona: 12 miles or 18 km N Sedonia, Coconino Co., 13-VIII-68, Pinus ponderosa, D. E. Bright; Bear Canyon, Santa Catalina Mts., 15-VIII-68, P. cembroides, D. E. Bright; Walker, Yavapai, 23-VIII-68, Pseudotsuga menziesii, D. E. Bright. Nevada: Kyle Canyon in Toyabe N.F., Clark Co., 10-V1-69, Pinus monophylla, W. G. Harwood. Texas: Madera Canyon in Davis Co., 19-VII74. P. ponderosa, D. E. Bright.

Notes.- The above treatment was based on the holotype and on 57 paratypes.

## 159. Pityophthorus zonalis Bright

Pityophthorus zonalis Bright, 1976, Great Basin Nat. 36:443 (Holotype, female; Jerome, Arizona; U.S. Nat. Mus.)
Diagnosis.- This species is distinguished from cuspidatus Blackman by the very long, dense, female frontal vestiture, by the more coarsely punctured pronotal disc, by the coarser strial punctures on disc and declivity, and by the narrower declivital interstriae 2 .

Female.- Length 2.2 mm. 3.0 times as long as wide; color dark brown.

Frons largely concealed by very dense, very long vestiture, length of setae equal to at least four-fifths distance between eyes.

Pronotum and elytral disc as in cuspidatus (strial punctures in definite rows) except declivity slightly steeper, sulcus moderately deep, punctures on striae 1 and 2 moderately large, impressed, sutural profile convex, interstriae 1 and 3 armed by tubercles.

Male.-Similar to female except frons weakly impressed, coarsely punctured, transverse carina at upper level of eyes weak; punctures on discal striae 1 and 2 slightly confused.
Distribution.- Arizona and Nuevo León.
USA: Arizona: Jerome, 22-X1-35. Pinus ponderosa. MEAICO: Nuevo León: 24 km E San Roberto, 5-V-71. P. cembroides, D. E. Bright.

Notes.- The above treatment was based on the holotype and on a male from Nuevo León that is presumed to be this species.

## 160. Pityophthorus cuspidatus Blackman

Pityophthorus cuspidatus Blackman, 1942, Proc. U.S. Nat. Mus. 92:217 (Holotype, female; Jacala, Hidalgo, Mexico; U.S. Nat. Mus., 55991)
Diagnosis.- This species is distinguished from cacuminatus Blandford by the very different frons in both sexes, by the deeper, more broadly impressed declivital sulcus, and by other characters indicated below.

Female.- Length $1.7-2.3 \mathrm{~mm}, 3.2$ times as long as wide; color reddish brown.

Frons plano-convex from epistoma to slightly above upper level of eyes, margins rounded, about four diameters of a facet from margin of eye; surface smooth, shining, rather coarsely, closely punctured, interspaces averaging slightly more than half diameter of a puncture; vestiture somewhat sparse, rather long, distinctly longer on margins, longest
setae equal in length to slightly more than half distance between eyes.

Pronotum 1.15 times as long as wide; outline as in allied species; posterior areas smooth, shining, with obscure, minute, impressed points indicated, punctures rather coarse, moderately close.

Elytra 2.0 times as long as wide, 1.8 times as long as pronotum; sides almost straight and parallel on basal three-fourths, strongly acuminate behind; striae not impressed except 1 slightly near declivity, punctures rather coarse, deep, in rows; interstriae smooth, shining, impunctate. Declivity steep, rather strongly sulcate, strongly acuminate at apex; striae 1 obsolete, 2 rather finely punctured; interstriae 1 moderately elevated, armed by a row of fine tubercles, 2 strongly impressed, twice as wide as 1 , subreticulate, 3 moderately elevated, armed by a row of rather coarse tubercles, as high or very slightly higher than suture on upper half. Vestiture restricted to declivity on oddnumbered interstriae, moderately long.

Male- - Similar to female except frons as in male delicatus; declivity more strongly impressed, tubercles slightly larger, interstriae 3 distinctly higher than suture.

Distribution.- Durango to Veracruz.
MEXICO: Durango: Durango, 37 and 96 km W Durango, El Salto. Hidalgo: Jacala. Mexico: Tequesqunahua. Puebla: Texmelucan. Veracruz: Texcoco.

Hosts.- Pinus ayacahuite, P. lumholtzii.
Biology. - Specimens were taken from small branches.

Notes. - The above treatment was based on the holotype and on 41 other specimens.

## 161. Pityophthorus acutus Blackman

Pityophthorus acutus Blackman, 1928, New York St. Coll. For., Syracuse. Tech. Pub. 25:134 (Holotype. female; Kaibab N.F., Arizona; U.S. Nat. Mus., 41321)
Diagnosis.- This species is distinguished from cuspidatus Blackman by the larger average size, by the different frons in both sexes, by the more strongly impressed declivity within striae 2 obsolete, and by other characters mentioned below.

Female.- Length 1.9-2.4 mm, 2.8 times as long as wide; color very dark brown.

Frons broadly plano-convex from epistoma to well above upper level of eyes, margins
obtusely subangulate, about three diameters of a facet from margin of eye; surface smooth, shining, closely, rather finely punctured, interspaces about equal to diameter of a puncture; vestiture moderately abundant, long, distinctly longer on margins.

Pronotum 1.13 times as long as wide; outline as in allied species; posterior area smooth, shining, finely to rather coarsely punctured (variable), moderately close. Vestiture confined to marginal and asperate areas.

Elytra 1.8 times as long as wide, 1.7 times as long as pronotum; outline and disc about as in cuspidatus. Declivity steep, strongly bisulcate, strongly acuminate at apex; punctures on striae 1 and 2 obsolete, interstriae moderately elevated, armed by a row of rather coarse granules; 2 strongly impressed, three times as wide as 1 , surface obscurely reticulate, 3 on upper half slightly higher than 1 , with a row of moderately coarse tubercles. Vestiture of fine, short, strial hair to base and, on declivity, moderately long interstrial hair except absent on 2 .

Male. - Similar to female except frons transversely impressed from epistoma to upper level of eyes, upper margin of impression with a strongly elevated transverse carina, surface rather coarsely punctured, vestiture inconspicuous; serrations on anterior margin of pronotum slightly larger; declivital sulcus deeper.

Distribution.- Utah and Colorado to Arizona and New Mexico.

USA: Arizona: Carr Canvon in Huachuca Mts., Rustler's Park in Chiricahua Mts.. Flagstaff. Kaibab N.F.. Oak Creek Canyon, Montezuma N.F., Santa Catalina Mts. Colorado: Colorado N.F., Estes Park. New Mexico: Cloudcroft, Emory Pass, Meek. Utah: Sanford Canyon.

Hosts.- Pinus flexilis, Pinus strobiformis.
Biology. - Specimens were taken from branches.

Notes.- The above treatment was based on the holotype and on 111 other specimens.

## 162. Pityophthorus spadix Blackman

Pityophthorus spadix Blackman. 1942, U.S. Nat. Mus. 92:219 (Holotype, female; Río Frío, Puebla, Mexico: U.S. Nat. Mus., 55993)
Diagnosis.- This species is distinguished from acutus Blackman by the larger size, by the (usually) confused elytral punctures, by the unarmed declivital interstriae 1 , and by other characters.

Female.- Length 2.3-3.0 mm, 2.9 times as long as wide; color dark brown.

Frons plano-convex to slightly above eyes, epistoma slightly elevated, lateral margins rounded, about four diameters of a facet from margin of eye; surface smooth, shining, very closely, uniformly, rather coarsely punctured; vestiture moderately abundant, uniformly distributed, long, a few longer setae on margins.

Pronotum 1.13 times as long as wide; outline as in acutus; posterior areas smooth, shining, punctures varying from small to moderately large; sparse vestiture limited to sides and asperate area.

Elytra 1.8 times as long as wide, 1.7 times as long as pronotum; outline as in acutus; striae usually not evident, punctures moderately to strongly confused, rather coarse,

Fig. 208. Antennae of Corthylini spp.: 49, Pseudopityophthorus puhipennis: 50, Pityotrichus barbatus; 51 , Pityoborus comatus; 52, Pityophthorus ramiperda; 53, Conophthorus coniperda. (After Blackman 1928:165.)
deep. Declivity steep, very strongly sulcate, apex strongly acuminate; striae 1 and 2 obsolete; interstriae 1 rather weakly elevated, unarmed (two or three fine tubercles sometimes present), 2 strongly impressed, twice as wide as 1 , finely reticulate, 3 strongly, rather abruptly elevated on upper half, much higher than suture, armed by 6-8 rather coarse tubercles. Vestiture of fine, short strial hair to base, interstrial setae on posterior third of dise and lateral areas on declivity rather long, interstriae 1 and 2 glabrous.

Male. - Similar to female except frons strongly, transversely impressed, a strongly elevated, transverse carina at upper level of eyes, surface smooth, shining, coarsely punctured, vestiture short, inconspicuous; declivital tubercles usually larger.

Distribution.-Chihuahua to Veracruz and Oaxaca.

MEXICO: Chihuahua: San Juanito, I6-III-74. Pinus, Hopk 5859I, M. M. Furniss. Durango: 17 km W El Salto, 7-VI-65, 2500 m , No. 39, Pinus pseudostrobus, S. L. Wood; 64 km W Durango, 4-VI- $65,2500 \mathrm{~m}$, No. 20. Pinus, S. L. Wood. Hidalgo: 17 km NE Jacala, 23-V1-53. Pinus, S. L. Wood. Mexico: Tequesquinabua, III-62, R. Coronado. Michoacán: 9 km E Volcan Parícutin, 19-VI$65,2500 \mathrm{~m}$, No. 89, Pinus, S. L. Wood. Puebla: Río Frio, 10-II-36. Pinus leiophylla, 692-1, D. DeLeon. Oaxaca: Nochixtlán, 17-VI-67, No. 56, Pinus, S. L. Wood. Veracruz: Texcoco, 5-II-62, Pinus, R. Coronado.

Hosts.-Pinus pseudostrobus, P. spp.
Biology.- Specimens were taken from shaded-out pine branches $2-7 \mathrm{~cm}$ in diameter.

Notes. - The above treatment was based on the holotype and on 34 other specimens.

## 163. Pityophthorus rubidus Wood

Pityophthorus rubidus Wood, 1978. Great Basin Nat. 38:400 (Ifolotype, female; Madera Canyon, Santa Rita Mts., Arizona; Wood Coll.)
Diagnosis.- This species is distinguished from spadix Blackman by the stouter body, by the reddish brown color, and by the confused discal punctures and the less strongly acuminate elytral apex and by other characters indicated below.

Female.- Length 2.3-3.0 mm, 2.6 times as long as wide; color reddish brown.

Frons plano-convex to slightly above eyes, ascending toward epistoma on lower fifth, particularly on median third, margins rounded, about three diameters of a facet
from margin of eye; surface smooth, shining, rather finely, closely, uniformly punctured, interspaces in central area equal in width to diameter of a puncture, less than half as great in marginal areas; vestiture of fine, moderately abundant long hair, longest setae about equal in length to half distance between eyes.

Pronotum 1.12 times as long as wide; widest at base, sides on posterior two-thirds feebly arcuate, moderately converging to rather narrowly rounded anterior margin; anterior margin armed by about 10-14 low serrations; summit at middle, rather high; posterior areas smooth, shining, with numerous impressed points, punctures coarse, deep, close. Glabrous on disc, sparse hair on sides and asperate area.

Elytra 1.6 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal three-fourths, rather abruptly rounded at base of declivity, strongly acuminate behind; striae 1 weakly impressed, rows obscurely visible, largely confused, punctures rather coarse, deep, close. Declivity very steep, rather strongly bisulcate, strongly acuminate at apex; striae 1 and 2 rather coarsely punctured; interstriae $1 \mathrm{mod}-$ erately elevated, armed by a row of small tubercles, 2 twice as wide as 1 , almost smooth, shining, impunctate, 3 on upper half slightly higher than 1 , armed by $6-10$ rather coarse, closely spaced tubercles. Vestiture on posterior third of disc and declivity long, moderately abundant on all interstriae.

Male. - Similar to female except frons transversely impressed from epistoma to upper level of eyes, a strong, transverse carina at upper level of eyes, surface coarsely punctured, vestiture inconspicuous; declivital tubercles slightly larger.

Distribution.-Arizona to Durango.
USA: Arizona: Madera Canvon, Santa Rita Mits., l-VI78, Pinus engelmannii, S. L. Wood. MEXICO: Durango: 35 km W Durango, 4-VI-65, 2000 m , No. 14, Pinus leiophylla, S. L. Wood; 40 km W Durango, 23-VII-53, Pinus. S. L. Wood.

Notes.- The above treatment was based on the type series of 77 specimens.

## 164. Pityophthorus megas Bright

Pityophthorus megas Bright, I976, Great Basin Nat. 36:436 (Holotype, female; Cerro Potosí, Nuevo León, Mexico: Canadian Nat. Coll.)

Diagnosis.- This species is distinguished from spadix Blackman by the larger size, by the slightly steeper, less strongly sulcate elytral declivity, and by the less strongly acuminate elytral apex.

Female.- Length $2.7-3.7 \mathrm{~mm}, 3.0$ times as long as wide; color very dark brown.

As in spadix except for elytral declivity. declivity as in spadix except slightly steeper, apex subacuminate, lateral convexities on upper half not as high, only slightly higher than suture, vestiture distinctly longer.

Male. - Similar to female except frons about as in male spadix but with transverse impression deeper; declivital sulcus deeper and lateral convexities higher than in female.

Distribution.- Nuevo León.
MEXICO: Nuevo Lén: Cerro Potosí, 4-V-71, 3800 m , Pinus cuminicola, D. E. Bright.

Notes. - The above treatment was based on the type series of 12 specimens.

## 165. Pityophthorus nemoralis Wood

Pityophthorus nemoralis Wood, 1976, Great Basin Nat. 36:351 (Holotype, female, Zamorano, Honduras; Wood Coll.)
Diagnosis.- This species is distinguished from regularis Blackman by the larger size, by the slightly impressed declivital interstriae 2 , and by the larger interstrial granules on the declivity. These two are unique in having a row of normal setae on declivital interstriae 2.

Female.- Length $1.4-1.8 \mathrm{~mm}, 2.6$ times as long as wide; color dark brown.

Frons uniformly convex; rugose-reticulate above eyes and laterally, lower areas smooth, shining, punctures deep, rather coarse, moderately close; vestiture sparse, short, inconspicuous.

Pronotum 1.04 times as long as wide; widest one-third pronotum length from base, sides weakly arcuate on basal half, a slight constriction on anterior half, rather narrowly rounded in front; anterior margin armed by about 10 low, basally contiguous serrations; summit indefinite, at middle; asperities in three concentric rows supplemented by those at summit, rows a bit irregular on median third; posterior areas reticulate, punctures deep, rather fine, moderately close. Sparse setae confined to margins.

Elytra 1.6 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal two-thirds, then slightly, arcuately converging, very broadly rounded behind; striae not impressed except 1 slightly near declivity, punctures small, deep, spaced by about two diameters of a puncture; interstriae smooth, shining, with a few faint irregular lines, three times as wide as striae, impunctate except at margin of declivity. Declivity steep, rather shallowly sulcate; striae 1 moderately impressed, punctures on 1 and 2 distinct, smaller than on dise; interstriae 1 moderately elevated, 2 moderately impressed, more strongly on median side, 3 very slightly higher than 1 , rounded, all with numerous impressed points, rows of tubercles on 1 very fine, 2 sometimes irregular, 3 slightly larger than on 1 and 2. Vestiture confined to declivity; strial setae very minute but usually present; interstrial setae erect, in regular rows including 2 , each very slightly longer than distance between rows.

Male.- Similar to female except serrations on anterior margin of pronotum and tubercles on declivity slightly larger.

Distribution.- Honduras to Costa Rica.
HONDURAS: Zamorano, Morazán, 18-IV-64, 700 m , No. 549, Aristochia anguicida, S. L. Wood. COSTA RICA: 8 km SE Cartago, Cartago, $1800 \mathrm{~m}, 29-\mathrm{VIL}-63$ (No. 91), 2-V111-63 (No. 100), liana. S. L. Wood.

Notes.- The above treatment was based on the type series of 44 specimens.

## 166. Pityophthorus concentralis Eichhoff

Pityophthorus conccutralis Eichhoff, 1878, preprint of Mém. Soc. Roy. Sci. Liége (2)8:188 (Holotype, sex?; Cuba; apparently lost with Hamburg Mus.; Neotype, female; Biscayne, Florida; U.S. Nat. Mus., designated by Bright, 1978, Great Basin Nat. 38:72)
Pityophthorus lateralis Swaine, 1917, Dom. Canada Dept. Agric. Ent. Br. Tech. Bull. 14(1):27 (Lectotype, female; Key West, Florida; Cornell Univ., designated by Bright. 1967, Canadian Ent. 99:678); Wood, 1957, Canadian Ent. 89:401. Synonymy
Diagnosis.- This species is distinguished from nemoralis Wood by the smooth, shining pronotal dise, by the row of punctures on discal interstriae 1 , by the row of punctures on declivital interstriae 2 , and by other characters indicated below.

Female.- Length 1.3-1.5 mm, 2.8 times as long as wide; color yellowish brown.

Frons plano-convex to upper level of eyes, margins rounded; surface smooth, shining, rather finely, not closely punctured; vestiture fine, short, sparse.
Pronotum 1.13 times as long as wide; sides almost straight and subparallel on basal half, rather broadly rounded in front; anterior margin armed by about 12 serrations; summit at middle, distinct; anterior slope with three to four concentric rows of basally fused asperities; posterior areas smooth, shining, moderately numerous impressed points very minute, punctures rather coarse, deep, moderately close. Disc glabrous, a few short setae at sides; concentric rows of setae arise from posterior margins of asperities.

Elytra 1.7 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal two-thirds, very broadly rounded behind; striae not impressed except 1 slightly near declivity, punctures coarse, deep, close; interstriae as wide as striae, smooth, shining, 1 usually punctured to base, others with a few punctures at base of declivity. Declivity very steep, shallowly bisulcate: striae 1 and 2 rather coarsely punctured, 1 impressed; interstriae 1 abruptly, rather weakly elevated, with a row of fine punctures, 2 wider than 1 , smooth, shining, ascending laterally, with a row of fine punctures, 3 convex, armed by a row of fine granules. Vestiture of fine short strial hair to base, and short to moderately long interstrial hair on and near declivity on all interstriae, those on declivital interstriae 1 and 2 short (sometimes short on entire declivity).

Male.- Similar to female except frons more distinctly convex, with puncture larger.

Distribution.- Florida to Cuba.
USA: Florida: Biscayne Bay, Dunedin, Everglades N.P., Key Vaca, Key West, Plantation Key, Royal Palm St. Pk., Stock Island, Sugar Loaf Key.

## Ноst.- Metopium toxiferum.

Biology.- This species was taken from the bole and larger branches.

Notes. - The above treatment was based on the neotype of concentralis, on the holotype of lateralis, and on 133 other specimens.

## 167. Pityophthorus coronarius Blackman

Pityophthorus coronarius Blackman, 1942, Proc. U.S. Nat. Mus. 92:220 (Holotype, female; Jalisco, Mexico; U.S. Nat. Mus., 55994 )
Diagnosis.- This variable species is probably more closely allied to mexicanus Blackman than to those associated with it in the above key. The pronotal asperities vary from subconcentric to completely confused and the elytral apex is moderately acuminate. The reticulate pronotum and the host are useful in distinguishing it.

Female.- Length $1.4-1.9 \mathrm{~mm}, 2.7$ times as long as wide; color brown.

Frons broadly flattened from epistoma to well above upper level of eyes, usually weakly concave on upper half, ascending slightly toward median area of epistomal margin; surface smooth, shining, punctures very fine, almost uniformly distributed (slightly less abundant in central area), interspaces equal to 2-4 diameters of a puncture; vestiture uniformly distributed, rather long, distinctly longer on margins.

Pronotum 1.1 times as long as wide; outline as in watsoni Schedl; anterior margin armed by about 12 serrations; summit at middle, distinct; asperities on anterior slope usually confused, one to three partial rows in concentric arrangement sometimes present; posterior areas strongly reticulate, punctures rather fine, moderately abundant, several of those on anterior half of disc with a shining granule on their posterior rims. Vestiture short, sparse, inconspicuous.

Elytra 1.8 times as long as wide, 1.7 times as long as pronotum; outline about as in watsoni except declivity much steeper, more strongly sulcate; striae not impressed except I near declivity, punctures in rows (occasionally very slightly confused), moderately coarse, deep; interstriae smooth, shining (slightly wrinkled in a few specimens), slightly wider than striae, impunctate except each with a few punctures or tubercles at base of declivity (including 2). Declivity very steep, rather strongly bisulcate; punctures on striae 1 obsolete, 2 rather coarsely, shallowly punctured; interstriae 1 rather abruptly, moderately elevated, armed by a sparse row of fine tubercles, 2 rather strongly impressed, almost twice as wide as 1 , surface subshining, minutely irregular, impunctate, 3 as high or
very slightly higher than 1 on basal half, armed by about a half dozen fine tubercles, lateral areas with two or three similar tubercles on each interstriae. Vestiture largely confined to declivity, consisting of setae of moderate length on all interstriae except 2 on face.

Male.- Similar to female except frons transversely impressed from epistoma to upper level of eyes, surface smooth, shining, rather coarsely, deeply punctured above, more finely below, vestiture fine, short, of moderate abundance; declivital sulcus slightly deeper, lateral tubercles slightly larger.

Distribution.- Jalisco.
MEXICO: Jalisco: 23 km NW Guadalajara, I9-VII-53, 1600 m , shrub, S. L. Wood; intercepted at quarantine in Sambucus bark of a crate.

Notes.- The above treatment was based on the type series of 65 specimens and on 17 other specimens.

## 168. Pityophthorus concinnus Wood

Pityophthorus concinnus Wood, 1977, Great Basin Nat. 37:214 (Holotype, female; intercepted at Nogales, Arizona, in wood from "Plaquepaque, Mexico"; U.S. Nat. Mus.)

Diagnosis.- This species is distinguished from coronarius Blackman by the larger size, by the more strongly impressed male frons, and by the longer, darker, more abundant setae on the female frons.

Female.- Length $1.7-2.3 \mathrm{~mm}, 2.7$ times as long as wide; color dark yellowish brown.

Frons similar to coronarius except a bit more strongly impressed, vestiture reddish brown, longer, much more abundant, longest setae equal in length to half distance between eyes.

Pronotum and elytra as in coronarius except lateral convexities on declivity conspicuously higher than suture.

Male.- Similar to female except frons rather strongly impressed from epistoma to upper level of eyes, upper margin of impressed area marked by a conspicuous, transverse carina.

## Distribution."Mexico."

MEXICO: Intercepted at Nogales, Arizona, in unidentified wood from "Plaquepaque, Mexico," 21-X-41, Lot No. 41-18984; and "Mexico," 22-III-62, Crump Colr., in unidentified wood intercepted at Boston 27132, No. 62-11725.

Notes.- The above treatment was based on the type series of 20 specimens.

## 169. Pityophthorus jeffreyi Blackman

Pityophthorus jeffreyi Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:113 (Holotype, female; Inyo N.F., Bishop, California; U.S. Nat. Mus. 41311)
Diagnosis.- The true affinities of this species and barberi Blackman probably lie nearer to lecontei Bright than to other species with concentric rows of pronotal asperities. It is distinguished from barberi by the regularly punctured discal interstriae, by the finer declivital granules, and by the very weak or obsolete male frontal carina.

Female.- Length $1.7-1.9 \mathrm{~mm}, 2.6$ times as long as wide; color dark reddish brown.

Frons somewhat flattened on median half from near epistoma to above eyes, sometimes transversely subcarinate at upper margin of impressed area; surface smooth, shining, rather coarsely, closely punctured; epistomal process indicated; vestiture fine, rather sparse, inconspicuous, consisting of a mixture of short and moderately long hair.

Pronotum 1.1 times as long as wide; widest near base, sides almost straight on basal half, converging very slightly, rather broadly rounded in front; anterior margin armed by about eight serrations; summit at middle, distinctly elevated; asperities in rather indefinite concentric rows, most rows broken at least once, some asperities independent, without bases fused (completely confused in some specimens); posterior areas smooth, shining, punctures rather coarse, close, deep. Vestiture confined to margins.

Elytra 1.6 times as long as wide, 1.6 times as long as pronotum; striae not impressed, punctures in rows, fine, rather deep; interstriae smooth, shining, usually with numerous fine, short, impressed lines, slightly more than twice as wide as striae, punctures usually regularly spaced, almost as large as those of striae. Declivity steep, very shallow, rather broadly sulcate; striae 1 and 2 with punctures fine, shallow; interstriae 1 distinctly elevated, minute granules mostly obsolete, 2 twice as wide as 1 , moderately impressed, surface subreticulate, impunctate, 3 as high as 1 , armed by about six small tubercles. Vestiture of
short, erect strial and interstrial hair to base, up to twice as long on declivity.

Male.-Similar to female except frontal impression more extensive, slightly deeper, carina more distinct; serrations on anterior margin of pronotum larger.
Distribution.- California to Oregon.
USA: California: Bishop, Inyo Co., Hopk. US 8794 i , J. D. Coffman; Myers Flat, Humboldt Co., F. B. Herbert; Old Station, Lassen Co., 29-X-47, S. L. Wood; Westgard Pass in Inyo Co., 6-IX-68, P. aristata, P. monophylla; all from Pinus ieffreyi except as noted. Oregon: Deschutes N.F., 19-IX-30, P. ponderosa, F. P. Keen; Klamath Falls, 1930, Hopk. U.S. 18189-c, P. ponderosa, F. P. Keen.

Host.- Pinus jeffreyi, P. ponderosa, probably accidental in other hosts.

Biology.- Specimens were taken from shaded-out branches 2 cm in diameter on a tree about 10 cm in diameter.

Notes.- The above treatment was based on the holotype and on 28 other specimens.

## 170. Pityophthorus barberi Blackman

Pityophthorus barberi Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:112 (Holotype, female; Las Vegas Hot Springs, New Mexico; U.S. Nat. Mıs., 41310)
Diagnosis.- This species is distinguished from jeffreyi Blackman by the almost impunctate discal interstriae, by the larger declivital granules, and by the strongly developed, transverse, male carina.

Female.- Length $1.7-2.2 \mathrm{~mm}, 2.7$ times as long as wide; color very dark reddish brown.

Frons about as in jeffreyi except flattened area less extensive, transverse carina at upper level of eyes much more strongly developed.

Pronotum as in jeffreyi except anterior margin usualy armed by 10 serrations; discal area sometimes indistinctly reticulate (variable).

Elytra similar to jeffreyi except surface often subreticulate or irregular, punctures larger, often slightly confused, evennumbered interstriae with few if any punctures, odd-numbered interstriae sparsely punctured. Declivity as in jeffreyi except surface reticulate, tubercles slightly larger. Vestiture of minute strial hair and moderately long interstrial hair; interstrial setae largely confined to odd-numbered declivital interstriae.

Male.-Similar to female except lower frons transversely impressed, transverse
carina strongly developed; serrations on anterior margin of pronotum larger.

Distribution.- Utah and Colorado to Durango and Nuevo León.

USA: Arizona: Flagstaff, Carr Canyon in Cochise Co., Pinaleno Mts. Colorado: El Paso Co., Ft. Garland, Manitou. New Mexico: Aragon, Bingham Summit, Kingston, Lake Roberts, Las Vegas, Nogal Lake, Sandia Mts. Utah: Beaver, Gooseberry area of Fishlake N.F., Panguitch. MEXICO: Durango: 37 km W Durango. Nuevo León: San Roberto.

Host.-Pinus cembroides, P. edulis.
Biology. - Specimens were taken from small shaded out and broken branches of living trees.

Notes.- The above treatment was based on the holotype and on 248 other specimens.

## 171. Pityophthorus torridus Wood

Pityophthorus torridus Wood, 1971, Great Basin Nat. 31:76 (Holotype, female; 6 miles W High Rolls, Lincoln N.F., New Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from mexicanus Blackman by the smaller size, by the darker color, by the less strongly acuminate elytral apex, and by other characters. It might be more easily confused with franseriae Wood, but the relationship is remote.

Female.- Length $1.8-2.0 \mathrm{~mm}, 2.9$ times as long as wide; color very dark reddish brown, almost black.

Frons broadly flattened from eye to eye, central half weakly concave; surface subshining, rather finely, uniformly, densely, deeply punctured; evenly, rather densely clothed by fine, long hair, setae near lateral and upper margins slightly longer.

Pronotum 1.1 times as long as wide; essentially as in franseriae Wood except anterior margin armed by 16 serrations and punctures in posterior areas finer.

Elytra 1.8 times as long as wide; sides straight and parallel on basal three-fourths, subacuminate behind; striae not impressed, punctures moderately coarse, deep; interstriae almost smooth, subshining, impunctate. Declivity steep, rather shallowly, broadly bisulcate; punctures of striae 1 and 2 very small, rather shallow; sutural interstriae moderately elevated, as high as lateral areas, interstriae 2 rather broadly, rather strongly impressed and impunctate, 1 and 3 each with a sparse row of pointed tubercles. Vestiture
confined to posterior half, of rather coarse, moderately long hair of moderate abundance.

Male.- Similar to female except frons weakly convex, coarsely, sparsely punctured, vestiture sparse, inconspicuous, a very weak median carina on lower half; pronotal punctures distinctly larger.

Distribution.- New Mexico.
USA: New Mexico: 10 km W High Rolls in Lincoln N.F., 2-VI-69, 2000 m, Franseria, S. L. Wood.

Host.- Franseria sp.
Biology. - Specimens were taken from stems $1-2 \mathrm{~cm}$ in diameter with franseriae.

Notes. - The above treatment was based on the type series of five specimens.

## 172. Pityophthorus mexicanus Blackman

Pityophthorus mexicanus Blackman, 1928. New York St. Coll. For., Syracuse, Tech. Pub. 25:121 (Holotype, female; Correen, Coahuila, Mexico; U.S. Nat. Mus., 41313)
Diagnosis.- This species is distinguished from torridus Wood by the larger size, by the coarser pronotal punctures, by the much more strongly sulcate elytral declivity, and by many other characters.

Female.- Length $2.0-2.9 \mathrm{~mm}, 2.8$ times as long as wide; color dark reddish brown.

Frons almost flat to well above eyes, lower fourth gradually ascending to epistomal margin, epistoma low, rather distinct; surface smooth, shining, closely, rather coarsely, umiformly punctured; lateral margin rather abrupt, separated from eye by distance equal to diameters of four facets; vestiture of fine, abundant, uniformly distributed long hair of uniform length, setae equal in length to onefourth distance between eyes.

Pronotum 1.07 times as long as wide; widest on basal fourth, sides almost straight and parallel on basal fourth then arcuately converging to rather broadly rounded anterior margin; anterior margin armed by $14-16$ serrations; summit at middle, low; anterior slope armed by about three concentric rows of asperities, rows usually broken or sometimes overlapping slightly at median line; posterior areas smooth, shining, punctures coarse, deep, close except on posterolateral areas. Vestiture of fine, short, rather sparse hair.

Elytra 1.7 times as long as wide, 1.6 times as long as pronotum; sides almost straight and
parallel on more than basal two-thirds, then abruptly rounded to strongly acuminate apex; striae not impressed except 1 slightly, punctures rather coarse, deep, usually in definite rows, occasionally slightly confused on posterior half; interstriae smooth, shining, slightly less than twice as wide as striae, usually sparsely punctured near declivity (occasionally punctured to base), sparse punctures similar to those of striae. Declivity steep, very strongly bisulcate; striae 1 impressed, punctures almost obsolete, 2 not impressed, moderately large punctures clearly impressed to near apex; interstriae 1 abruptly, rather strongly elevated, armed by sparse, moderately coarse tubercles, 2 broadly, strongly impressed, smooth, shining, impunctate, 3 on upper two-thirds abruptly, strongly elevated, conspicuously higher than suture, summit armed by about six low, often rounded tubercles. Vestiture consisting of short strial hair to base and longer interstrial hair on and near declivity.

Male. - Similar to female except frons convex, a slight transverse impression on lower half, epistomal process a low fold on median half, procurved almost to epistomal margin, surface much more coarsely punctured, vestiture inconspicuous except for epistomal brush; tubercles on lateral margins of declivity slightly larger.

Distribution.- Coahuila to Jalisco and Tabasco.

MEXICO: Coahuila: Correen, Hopk. U.S. 6094, rubber plant; Torreon, 16-VI-45, guavule, V. E. Romney. Jalisco: Chapala, Hopk. U.S. 8949, N. D. Cattila. Tabasco: Intercepted at the state border or "frontera" in rubber tree.

Ноst.-Parthenium argentatum.
Biology.- This species breeds in the cut or unthrifty stems of the guayule plant (Lloyd 1911:43-45).

Notes.- The above treatment was based on the holotype and on 21 other specimens. lnformants report this species from New Mexico and Texas; however, voucher specimens have not been located.

## 173. Pityophthorus scriptor Blackman

Pityophthorus scriptor Blackman, 1921, Mississippi Agric. Expt. Sta. Tech. Bull. 10:7 (Lectotype, female; Agricultural College, Mississippi, U.S. Nat. Mus., designated by Bright, 1976, Coleopt. Bull. 30:184)

Diagnosis.- This species, virilis Blackman, hylocuroides Wood, and crinalis Blackman form a distinctive group, all of which normally breed in Rhus. This species is distinguished by the less strongly impressed declivital sulcus, with the lateral margins and tubercles less strongly developed, and by the more finely punctured female frons with less abundant vestiture.

Female.- Length 1.3-1.5 mm, 2.7 times as long as wide; color dark reddish brown.

Frons broadly plano-convex from epistoma to well above eyes, lateral margins subangulate, separated by distance equal to diameter of three facets from lateral margin of eye; surface smooth, shining, finely, rather closely, uniformly punctured; vestiture of fine, moderately abundant hair of about uniform length.

Pronotum 1.09 times as long as wide; widest near base, sides on basal half weakly arcuate, converging slightly, rather broadly rounded in front; anterior margin armed by about 14 serrations; summit at or slightly anterior to middle, a distinct, transverse impression behind summit; anterior slope armed by three subconcentric rows of asperities, each row usually broken at or near median line, posterior areas smooth, shining, numerous minute impressed points present, punctures coarse, deep, rather close. Glabrous except at margins.

Elytra 1.7 times as long as wide, 1.6 times as long as pronotum; sides almost straight and subparallel on basal two-thirds, obtusely subangulate behind; striae not impressed, punctures rather coarse, deep; interstriae slightly less than twice as wide as striae, surface almost smooth, impunctate except 2 near declivity. Declivity steep, rather shallowly bisulcate; striae 1 almost obsolete, 2 rather coarsely, deeply punctured to apex; interstriae 1 abruptly, distinctly elevated, armed by a row of fine granules, 2 moderately, broadly impressed, twice as wide as 1 , three or four fine granules at base, smooth, shining, impunctate, 3 distinctly elevated on upper half, as high as suture, armed by about six fine granules. Vestiture largely confined to declivity, sparse, rather short.

Male.-Similar to female exept frons rather strongly, transversely impressed from epistoma to above upper level of eyes, a
rather strong, transverse carina at upper margin of impression, punctures sparse, obscure, vestiture sparse, short, inconspicuous; declivital sulcus slightly deeper, lateral tubercles slightly larger.

Distribution.- North Carolina to Texas and Georgia.

USA: Georgia: Macon. Mississippi: Corinth. New Albany. Starkville. North Carolina: Tryon. Tennessee: Gatlinburg. Texas: Kerrville, Montell, Pine Springs.

Host.- Rhus typhina.
Notes. - The above treatment was based on the holotype and on 153 other specimens.

## 174. Pityophthorus virilis Blackman

Pityophthorus tirilis Blackman, 1928. New York St. Coll. For., Syracuse, Tech. Pub. 25:143 Holotype, female; Vermego. New Mexico; L'S. Nat. Mus. 41327)

Pityophthorus fortis Blackman, 1928, New York St. Coll. For.. Syracuse. Tech. Pub. 25:142 (Holotype, female; Montell, Texas; U.S. Nat. Mus., 41326); Bright, 1977. Canadian Ent. 109:518. Synonymy
Diagnosis. - This species is distinguished from hylocuroides Wood by the more finely punctured female frons and by the less broadly flattened male elytral declivity, with the lateral margin subacutely elevated only near the apex.
Female.- Length $1.4-1.8 \mathrm{~mm}, 2.8$ times as long as wide; color rather dark reddish brown.

Frons as in scriptor Blackman except punctures smaller.

Pronotum as in scriptor except with fewer serrations on anterior margin.

Elytra as in scriptor except discal interstriae 2 and 4 punctured at least on posterior half (to base in some specimens); declivity steeper, more strongly sulcate, lower declivity more broadly flattened, ventrolateral margin subacutely elevated near apex, interstriae 1 unarmed except with one or two granules near apex, 2 almost three times as wide as 1 , 3 more strongly elevated on upper half, much higher than suture, tubercles much larger.

Male- - Similar to female except slightly stouter; frons as in male scriptor; declivity more strongly sulcate, lateral elevations higher on upper half.

Distribution.- Utah and Wyoming to Chihuahua and W Texas.

USA: Arizona: Arivaca Road, Chiricahua Mts., Lakeside. Colorado: Canyon City, El Paso Co., Glen Eyrie, Poudre Canyon in Larimer Co. Missouri: Union. New Mexico: Vermego. Texas: Big Band N.P., David Mts., Montell. Utah: Kanab, Logan, Provo, River Heights, Springville, Tabiona. Wyoming: Lusk. MEXICO: Chihuahua: La Pinta.

Host.-Rhus trilobata.
Biology.- This species breeds in the larger stems of the host. The parental tunnels engrave the wood rather deeply; the egg galleries are longer than normal for this genus.

Notes.- The above treatment was based on the holotypes of virilis and fortis and on 371 other specimens.

## 175. Pityophthorus hylocuroides Wood

Pityophthorus hylocuroides Wood, 1964, Great Basin Nat. 24:69 (Holotype, female; 11 miles NE Jacala, Hidalgo, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from virilis Blackman by the more coarsely punctured female frons and by the more broadly flattened lower male declivity, with the lateral margin subacutely elevated from the apex to above the middle of the declivity.

Female.- Length $1.4-1.7 \mathrm{~mm}, 2.8$ times as long as wide; color dark reddish brown.

Frons similar to virilis except slightly more convex, punctures conspicuously larger, interspaces much narrower than diameter of a puncture (twice as wide in virilis).

Pronotum and elytral dise as in scriptor. Elytral declivity intermediate between scriptor and virilis.

Male. Similar to female except frons about as in male scriptor; declivity as strongly impressed as male virilis except lower area more strongly, more broadly flattened, lateral margin subacutely elevated from apex to more than half distance to base, four or five tubercles on interstriae 3 in normal position but appearing displaced mesad from lateral margin, much as in certain male Hylocurus.

Distribution.- Hidalgo.
MEXICO: Hidalgo: 17 km NE Jacala, 27-VI-53, Rhus, S. L. Wood.

Host.- Rhus possibly aromatica.
Notes. - The above treatment was based on the type series of 14 specimens.

## 176. Pityophthorus costatulus Wood

Pityophthorus costatulus Wood, 1976, Great Basin Nat. 36:351 (Holotype, female; 18 miles or 29 km W Niltepec, Oaxaca, Mexico; Wood Coll.)

Diagnosis.- This species is distinguished from costabilis Wood by the smaller average size, by the straight suture 1 of the antennal club, and by declivity interstriae 2 being impressed only on the mesal side in the female.

Female.- Length $0.9-1.2 \mathrm{~mm}, 2.6$ times as long as wide; color very dark brown.

Frons flattened on a rather narrow area to well above upper level of eyes, slightly elevated toward epistomal margin, margins obtusely subangulate, laterally separated from margin of eye by distance equal to diameters of four facets; surface smooth, shining, punctures moderately coarse, deep, close, spaced by distances equal to less than half diameter of a puncture except more widely spaced on median third near epistoma; vestiture very fine, moderately abundant, uniformly distributed, slightly longer at margins, longest setae equal to about one-fourth distance between eyes. Antennal club small, oval; suture 1 straight, mostly septate, 2 moderately procurved, usually not septate.

Pronotum 1.1 times as long as wide; widest near base, sides on basal half almost straight, converging very slightly, rather narrowly rounded in front; anterior margin broadly armed by a subserrate continuous costa; summit at middle, distinct; anterior slope armed by three continuous, subserrate costae, a fourth at summit; posterior areas smooth, shining, with numerous impressed points, punctures moderately coarse, rather widely spaced. A row of setae behind each costa; posterior area glabrous.

Elytra 1.6 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal two-thirds, rather broadly rounded behind; striae not impressed, punctures rather fine, close, deep; interstriae smooth, shining, with a few irregular, indefinite surface lines, twice as wide as striae, impunctate. Declivity steep, convex; striae 1 impressed, 2 not impressed, both with punctures smaller than on disc, impressed; interstriae 1 distinctly, abruptly elevated, armed by a row of fine granules, 2 weakly impressed, as wide as 1 , with one or two punctures near apex and at base, 3 not elevated, rounded, armed by about six fine granules. Vestiture largely confined to declivity, consisting of sparse rows of short, stout setae on odd-numbered interstriae.

Male.-Similar to female except frons rather strongly convex, more coarsely punctured, transverse impression above epistoma deeper, vestiture much shorter, less abundant; declivital interstriae 1 without granules, punctures on declivital striae 1 and 2 smaller.

Distribution.- Jalisco to Oaxaca.
MEXICO: Jalisco: 16 km W Tizapán, 18-VII-53, Thecetia, S. L. Wood. Oaxaca: 29 km W Niltepec, 23-VI-67, 30 m . No. 87 , Thecetia, S. L. Wood.

Biology.- This species was removed from the cambium region of leaf-bearing terminal twigs, where it was intermixed with $L i$ parthrum cracentis Wood.

Notes.- The above treatment was based on the type series of 24 specimens.

In some respects the antennal club of this species resembles that of certain Araptus more closely than that of other Pityophthorus. In the closely related costabilis, however, suture 2 is usually at least feebly septate. This fact, the small size of the club, the tibial characters, habits, and other less tangible features suggest placement of these species in Pityophthorus. The two known species of Araptus having the pronotal asperities arranged concentrically are entirely unrelated to costatus and costabilis both anatomically and biologically.

## 177. Pityophthorus costabilis Wood

Pityophthorus costabilis Wood, 1976, Great Basin Nat. 36:352 (Holotype, female; 10 miles or 16 km W Tizapán, Jalisco, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from costatulus Wood by the larger size, by the much more strongly procurved sutures of the antennal club, by the more coarsely punctured declivital striae in the female, and by the more conspicuous epistomal brush of the male.

Female.- Length $1.6-1.8 \mathrm{~mm}, 2.6$ times as long as wide; color very dark brown, almost black.

Frons largely concealed in specimens at hand, evidently similar to costatulus except coarsely punctured, vestiture apparently less abundant, shorter. Antennal club with sutures 1 and 2 rather strongly procurved, 2 weakly, more distinctly septate near margins.

Pronotum about as in costatulus except crest of costae more strongly serrate.

Elytra as in costatulus except strial punctures slightly larger, deeper; declivital striae 1 and 2 more coarsely punctured, interstriae 1 unarmed, 2 more strongly impressed, 3 rounded, slightly elevated, without granules, vestiture similar but more closely spaced, an occasional seta on interstriae 4,6 , and 8 .

Male.-Similar to female except frons as in costatulus, with all features more strongly developed; strial punctures on disc half as large as in female, those on declivity minute, interstriae 3 with minute granules.
Distribution- Jalisco.
MEXICO: Jalisco: 16 km W Tizapán, 18-VI-53, Thetetia, S. L. Wood.

Biology.- Specimens were taken in stems $1-2 \mathrm{~cm}$ in diameter in association with costatulus.

Notes. - The above treatment was based on the type series of eight specimens.

## 178. Pityophthorus detentus Wood

Pityophthorus detentus Wood, 1976, Great Basin Nat. 36:352 (Holotype, female; Carapan, Michoacán, Mexico; Wood Coll.)
Diagnosis. - This species is distinguished by the broadly convex elytral declivity, with strial punctures 1 and 2 minute and interstriae 1 not elevated, and by the male and female frons as described below.

Female.- Length 1.4-1.8 mm, 2.6 times as long as wide; color brown.

Frons flat to well above eyes, ascending slightly toward epistomal margin on lower fourth, lateral margins subangulate, separated from eye by distance equal to diameter of three facets; surface smooth, shining, punctures in central area very small, rather widely spaced, larger and more numerous at margins; vestiture sparse and rather short in central area, moderately abundant and very long at margin. Antennal club 1.5 times as long as wide, septum in suture 2 almost obsolete.

Pronotum 1.04 times as long as wide; outline about as in costatulus Wood except rows of asperities divided to their bases, not costiform, impressed points largely obsolete, punctures rather small; anterior margin armed by about 18 serrations.

Elytra 1.7 times as long as wide, 1.6 times as long as pronotum; outline and disc as in costatulus; declivity steep, broadly convex, striae 1 feebly impressed, 1 and 2 minutely
punctured, interstriae 1 weakly elevated, unarmed, sparse, punctures minute, 2 not impressed, almost twice as wide as 1,3 not elevated, punctures small, widely spaced. Vestiture of minute strial setae and with interstrial setae as in costabilis Wood.

Male.- Similar to female except frons distinctly impressed, its margin forming a distinctly elevated crest outlining a semicircle from lateral margin of epistoma to slightly above eyes, punctures coarse, not close, vestiture short, sparse.

Distribution.- Michoacán to Queretaro.
MEXICO: Michoacán: Carapan, 18-VI-65, 2300 m , woody vine, S. L. Wood; 10 km E Volcán Parícutin, 19-VI-65, 2500 m , probably Toxicodendron, S. L. Wood. Querétaro: 16 km E Landa de Matamores, 11-VI-71, 1800 m, D. E. Bright.

Notes.- The above treatment was based on the type series of 31 specimens and on 7 other specimens.

## 179. Pityophthorus inops Wood

Pityophthorus inops Wood, 1976, Great Basin Nat. 36:353 (Holotype, female; Rincón, Osa Peninsula, Costa Rica; Wood Coll.)
Diagnosis.- In this species and debilis Wood sutures 1 and 2 on the antennal club are virtually obsolete. This species is distinguished from debilis by the smaller size, by the strongly reticulate pronotum, by the reticulate frons, and by other characters indicated below.

Female.- Length $1.1-1.2 \mathrm{~mm}, 2.7$ times as long as wide; color yellowish brown.

Frons plano-convex from epistoma to slightly above upper level of eyes, lateral margins subangulate, separated from margin of eye by distance equal to diameter of one facet; surface apparently reticulate, oral area pale and covered by short, rather abundant hair, upper area with fine, uniformly distributed punctures, upper margin above upper level of eyes bearing a fringe of very long, yellow hair, tips exceeding epistomal margin. Antennal club subcircular, sutures 1 and 2 moderately procurved, marked only by very obscure lines, not marked by setae.

Pronotum 1.1 times as long as wide; outline as in costatulus Wood; anterior margin subcostate, with about 14 serrations obscurely indicated; summit at middle; anterior slope with two concentric rows of asperities,
those near summit largely confused; posterior areas reticulate, punctures fine, not close. Vestiture confined to lateral margins and asperate area.

Elytra 1.7 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal two-thirds, rather broadly rounded behind; striae not impressed, punctures very fine, shallow, spaced within a row by two to four diameters of a puncture; interstriae smooth, shining, with numerous impressed points, about three times as wide as striae. Declivity steep, broadly convex; striae 1 and 2 punctured as on disc; interstriae 1 weakly elevated, a few minute granules obscurely indicated, 2 as wide as 1 , very feebly impressed, 3 not elevated, armed by a row of very fine granules. Strial setae very short, very fine, confined to posterior half; oddnumbered interstriae with rather sparse, narrowly spatulate setae on and near declivity.

Male. - Similar to female except frons more strongly convex, a slight transverse impression above epistoma, fully reticulate, punctures slightly larger.

Distribution.- Costa Rica.
COSTA RICA: Rincón on Osa Peninsula, Puntarenas, 11-VII-66, 30 m , No. 85, unidentified tree limb, S. L. Wood.

Notes.- The above treatment was based on the type series of seven specimens.

## 180. Pityophthorus debilis Wood

Pityophthorus debilis Wood, 1976, Great Basin Nat. 36:354 (Holotype, female; San Ignacio de Acosta, San José, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from inops Wood by the slightly larger size, by the shining lower frons and pronotum, by the longer setae on the female frons, and by the presence of setae on all interstriae.

Female.- Length $1.2-1.4 \mathrm{~mm}, 2.7$ times as long as wide; color yellowish brown.

Frons about as in inops except marginal fringe of hair extending from dorsal margin to lower lateral margins, short setae in lower central area apparently absent; surface shining from epistoma to upper level of eyes.

Pronotum as in inops except serrations on anterior margin more deeply divided, disc usually shining, obscurely reticulate in some specimens.

Elytra as in inops except strial punctures slightly larger, declivital interstriae 2 weakly, more distinctly impressed; all interstriae on declivity with erect, blunt setae, except absent on 2 below basal margin.

Male. - Similar to female except frons convex, with punctures coarse and vestiture very short, sparse, inconspicuous.

Distribution.- Chiapas to Costa Rica.
MEXICO: Chiapas: 15 km SE Teopisca, $14-\mathrm{V}-69$, D. E. Bright. COSTA RICA: San Ignacio de Acosta, San José, 4 -VII- $63,1500 \mathrm{~m}$, No. 28 from unidentified branch, No. 32 from Mauria glauca, S. L. Wood.

Biology.- Specimens were taken from twigs 1 cm in diameter. The short, longitudinal egg galleries engraved the wood deeply.

Notes. - The above treatment was based on the type series of 40 specimens and on 10 other specimens. The series from Chiapas differs very slightly but almost certainly is of this species.

## 181. Pityophthorus juglandis Blackman

Pityophthorus juglandis Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:42 (Holotype, female; Lone Mountain, New Mexico, U.S. Nat. Mus., 41271)
Diagnosis.- This species is distinguished by having four to six concentric rows of pronotal asperities, by the dull (shagreened) declivital surface, and by other characters described below.

Female. - Length $1.5-1.9 \mathrm{~mm}, 2.8-3.1$ times as long as wide; color yellowish brown.

Frons flat to plano-concave, slightly elevated toward epistomal margin, lateral margins rather abruptly rounded, spaced from margin of eye by distance equal to two to three diameters of a facet; surface smooth, shining, rather finely, closely, uniformly punctured; vestiture rather abundant, much longer at margins, longest setae equal to half distance between eyes. Antennal club with sutures 1 and 2 septate, almost straight.

Pronotum 1.10-1.16 times as long as wide; sides almost straight and parallel on basal half, rather broadly rounded in front; anterior margin armed by about 18 serrations; summit at or slightly in front of middle; anterior slope armed by four to six concentric rows of asperities, each usually broken and often overlapping near median line; posterior area
smooth, shining, with numerous impressed points, punctures moderately large, rather close. Vestiture minute on disc, longer, and arranged in rows with asperities on anterior slope.

Elytra 1.8-1.9 times as long as wide, 1.7 times as long as pronotum; sides straight and parallel on basal three-fourths, rather broadly rounded behind; striae not impressed except 1 slightly near declivity, punctures in rows, moderately coarse, interstriae smooth, shining, impunctate, about one and one-half times as wide as striae. Declivity steep, very shallowly bisulcate; striae 1 impressed, 1 and 2 very finely punctured; interstriae 1 rather wide, moderately elevated, with a very sparse row of fine punctures, 2 as wide as 1 , slightly impressed on mesal side, surface smooth, slightly shagreened, 3 with a sparse row of fine punctures. Minute, very short strial setae extend to base; interstrial setae largely confined to declivity, in very sparse rows on odd-numbered interstriae.

Male. - Similar to female except frons very broad, strongly concave, more coarsely punctured, vestiture short, less abundant; inconspicuous; declivital interstriae 1 and 2 each with a row of fine granules.

Distribution.-S California and New Mexico to Chihuahua.

USA: Arizona: Chiricahua Mts., Miller Canyon in Huachuca Mts., Paradise, Peña Blanca, Portal. California: San Fernando, Tarzana. New Mexico: Lone Mountain. MEXICO: Chihuahua: Ciudad Chihuahua.

Host.- Juglans californica, J. major, J. nigra.

Biology. - Specimens were taken from small branches from July to September.

Notes.- The above treatment was based on the holotype and on 73 other specimens.

## 182. Pityophthorus tenax, Wood

Pityophthorus tenax Wood, 1976, Great Basin Nat. 36:354 (Holotype, female; Volcán Pacaya, Esquintla, Guatemala; Wood Coll.)
Diagnosis.- This species is distinguished from juglandis Blackman by the absence of long hair on the female frons, by the more abundant, longer interstrial setae on all declivital interstriae except 2 , by the steeper, more shining declivity, and by other characters.

Female.- Length $1.6-1.7 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown.

Frons broadly convex, epistomal margin distinctly elevated; surface smooth and shining below upper level of eyes, reticulate above, punctures rather coarse, vestiture short, sparse, inconspicuous. (Upper areas on holotype concealed by pronotum, not fully visible.)

Pronotum 1.17 times as long as wide; pronotum as in juglandis except anterior margin armed by about 10 serrations and punctures on posterior areas slightly larger.

Elytra 1.7 times as long as wide, 1.5 times as long as pronotum; outline as in juglandis except sides on posterior third converging more conspicuously, declivital area narrower; striae as in juglandis except punctures slightly larger, interstriae as wide as striae. Declivity much as in juglandis except striae 1 more strongly impressed, interstriae 2 ascending laterally more strongly, 1 and 3 without granules; surface smooth, shining, not shagreened. Interstrial setae largely confined to declivity, on all interstriae except absent on 2, slightly longer and much more closely spaced than in juglandis.

Male. - Similar to female except frons very slightly more strongly convex.

Distribution.- Guatemala.
guatemala: Volcán Pacaya, l-VI-64, 1300 m , No. 692, unidentified branch, S. L. Wood.

Notes.- The above treatment was based on the type series of three specimens.

## 183. Pityophthorus strictus Wood

Pityohthorus strictus Wood, 1976, Great Basin Nat. 36:35t (Holotype, female: Santa Ana, San José, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from tenax Wood by the presence of a few long setae on the female frons, by the much more finely punctured frons, pronotum, and elytra, and by the different declivity as described below.

Female.- Length $1.3 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown.

Frons as in tenax, with punctures much finer, about a dozen long setae in lateral areas on lower half, a somewhat indistinct median callus above upper level of eyes.

Pronotum 1.08 times as long as wide; about as in tenax except anterior margin costate, its crest weakly serrate, and posterior areas rather finely punctured.

Elytra 1.7 times as long as wide, 1.7 times as long as pronotum; as in tenax except strial punctures smaller, interstriae one and onehalf times as wide as striae, declivity more strongly convex, striae 1 less strongly impressed, interstriae 1 and 3 with very fine granules.

Male. - Similar to female except frons very slightly more strongly convex and without any long setae.

Distribution.- Costa Rica.
COSTA RICA: Santa Ana, San José, 30-VIII-63, 1300 m, No. 157, Rheedia edulis branches, S. L. Wood.

Notes.- The above treatment was based on the type series of six specimens.

## 184. Pityophthorus franseriae Wood

Pityohthorts franseriae Wood, 1971, Great Basin Nat. 31:75 (Holotype, female; 6 miles W High Rolls, Lincoln National Forest, New Mexico; Wood Coll.)
Diagnosis.- This species is distinguished by the obsolete declivital striae 1 and 2 , by the presence of setae only on the oddnumbered interstriae, by the distinctive frons in both sexes as described below, and by other characters.

Female.- Length $1.2-1.3 \mathrm{~mm}, 2.7$ times as long as wide; color very dark reddish brown.

Frons flattened on a rather narrow area from epistoma to well above eyes, lateral margins very obtusely subangulate, separated from eye by distance equal to width of four facets; surface smooth, shining, punctures fine, close, uniformly distributed except almost impunctate on small median area near epistoma; vestiture of very fine, moderately abundant, rather short hair of uniform distribution and length.

Pronotum 1.03 times as long as wide; widest behind middle, sides moderately arcuate on slightly more than basal half, rather broadly rounded in front; anterior margin armed by eight subcontiguous, coarse teeth; anterior slope armed by three concentric rows of asperities; posterior area shining, punctures rather fine, deep, moderately sparse, median line impunctate. A few small setae at margins.

Elytra 1.6 times as long as wide; sides almost straight and parallel on basal threefourths, abruptly rounded, then feebly acuminate at apex; striae not impressed, punctures
rather coarse, deep; interstriae almost smooth, almost as wide as striae, impunctate. Declivity steep, very shallow, broadly bisulcate; surface shining, impunctate; sutural interstriae distinctly elevated, 2 shallowly impressed, 3 weakly elevated, 2 and 3 each armed by widely spaced, very fine granules. Odd-numbered interstriae on declivity each bearing a row of moderately long, fine setae.

Male. - Similar to female except frons with a well-developed transverse carina at vertex, frontal area slightly impressed, with moderately coarse punctures in lateral areas, vestiture less conspicuous, sparse.

Distribution.- New Mexico.
USA: New Mexico: 6 miles or 10 km W High Rolls, Lincoln N.F., 2-V1-69, Franseria, S. L. Wood.

Biology.- Specimens were taken from the cambium region of small stems less than 2 cm in diameter.

Notes.- The above treatment was based on the type series of 58 specimens.

## 185. Pityophthorus nanus Wood

Pityophthorus nanus Wood, 1964, Great Basin Nat. 24:64 (Holotype, female: Totolapan, Оахаса, Mexico: Wood Coll.)
Diagnosis.- This species is distinguished by the unique mustachelike female frontal pubescence, by the absence of granules on declivital interstriae 1, and by other characters indicated below.

Female.- Length $1.2-1.5 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown.

Frons broadly convex; surface smooth, shining, rather densely, finely punctured on area below upper level of eyes; vestiture of fine, abundant, very long, uniformly distributed hair on lower two-thirds of area below upper level of eyes.

Pronotum 1.2 times as long as wide; widest near base, sides straight and converging very slightly on basal half, rather narrowly rounded in front; anterior margin a serrate costa; summit slightly anterior to middle; anterior slope armed by four concentric rows of basally fused asperities; posterior areas smooth, shining, some very minute impressed points usually present, punctures fine, rather shallow. Vestiture consisting of rows of setae behind asperities and minute, sparse setae on sides, dise glabrous.

Elytra 1.7 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal two-thirds, broadly rounded behind; striae not impressed, punctures moderately coarse, rather close; interstriae smooth, shining, two to two and one-half times as wide as striae. Declivity steep, shallowly bisulcate; striae 1 impressed, punctures not evident, 2 not impressed, punctures about half as large as on disc, clearly impressed, interstriae 1 distinctly elevated, unarmed, punctures not clearly evident, 2 moderately impressed on median side, gradually, weakly ascending laterally, surface smooth, shining, about one and one-half times as wide as 1,3 convexly rounded, with a few setiferous punctures similar to those of striae. Vestiture confined to odd-numbered declivital interstriae, short, sparse.

Male. - Similar to female except frons shallowly, transversely impressed from epistoma to upper level of eyes, sometimes subconcave in central area, a distinct median callus at upper level of eyes, vestiture short, fine, inconspicuous; upper half of declivity more strongly impressed, lateral margins much higher than suture and armed by two or three fine to moderately coarse denticles.

Distribution.- Jalisco to Oaxaca.
MEXICO: Chiapas: Junction Highways 190 and 195, 12-V-69, D. E. Bright. Jalisco: Barra de Navidad, IX-65, N. L. H. Krauss; 21 km N Juchitlán, 2-VII-64, 1000 m , No. 180, Bursera, S. L. Wood; 42 km N Rosamorada, $15-$ Vil-65, 100 m . No. 253, Bursera, S. L. Wood. Oaxaca: 13 km SE Cameron, 21-V1-67, No. 55, Bursera, S. L. Wood; Totolapan, $7-\mathrm{VII}-53$ and $20-\mathrm{VI}-67,1100 \mathrm{~m}$, Bursera, S. L. Wood.

Notes.- The above treatment was based on the type series of 9 specimens and on 38 other specimens.

## 186. Pityophthorus galeritus Wood

Pityophthorus galeritus Wood, 1976, Great Basin Nat. 36:355 (Holotype, female; Río Damitas in the Dota Mts., San José, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from nanus Wood by the more extensively distributed female frontal vestiture, by the less strongly impressed male frons, by the more shallowly sulcate male declivity, and by other characters.

Female.- Length $1.1-1.2 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown.

Frons plano-convex on a rather limited area from epistoma to well above eyes, lateral margins rounded, separated from margin of eye by distance equal to width of four facets; surface smooth, shining, rather coarsely, closely punctured; vestiture fine, moderately abundant, uniformly distributed, of uniform length, rather short.

Pronotum as in nanus except posterior areas with numerous strongly impressed points, punctures deeper, evidently very slightly larger.

Elytra as in nanus except strial punctures on disc closer, deeper, declivity slightly narrower, appearing deeper, interstriae 3 higher than 1,1 and 3 armed by very fine tubercles, vestiture confined to declivital area on all interstriae except 2 , setae much stouter, more closely spaced.

Male.-Similar to female except frons subconcavely impressed on median half of area between epistoma and upper level of eyes, upper margin transversely subcarinate, surface smooth, shining, coarsely punctured, vestiture fine, short, inconspicuous; declivital setae slightly stouter.

Distribution.- Costa Rica.
COSTA RICA: Río Damitas, Duta Mts., San José, 18-$11-64,250 \mathrm{~m}$, No. 434 , Rheedia edulis, S. L. Wood.

Biology.-Specimens were taken in the cambium region of a tree 25 cm in diameter.

Notes. - The above treatment was based on the type series of five specimens.

## 187. Pityophthorus nebulosus Wood

Pityophthorus nehulosus Wood, 1976, Great Basin Nat. 36:355 (Holotype, female; Lake Catemaco, Veracruz, Mexico; Canadian Nat. Coll.)
Diagnosis.- This species is distinguished from nanus Wood by the very different female frons, by the smaller elytral punctures, and by the much more shallowly sulcate declivity.

Female.- Length $1.4-1.7 \mathrm{~mm}, 3.0$ times as long as wide; color yellowish brown.

Frons transversely impressed from epistoma to upper level of eyes, upper margin subangulate; surface shining, rather coarsely, closely punctured except sparsely on small central area; vestiture of moderately abundant, rather long hair about uniformly distributed over impressed area.

Pronotum as in nanus except asperities in less definite rows, punctures on dise slightly smaller, disc more shagreened.

Elytra as in nanus except discal punctures smaller, declivital sulcus very shallow, interstriae 2 flat, 1 as high as 3 , shagreened. Vestiture confined to odd-numbered declivity interstriae, sparse, each seta flattened on its apical third, appearing narrowly spatulate.

Male.- Similar to female except slightly smaller, frontal impression restricted to lower half, deeper, punctures less abundant, more uniformly distributed, vestiture short, sparse, inconspicuous; declivital impression wider, distinctly deeper (but much less strongly impressed than in nanus), lateral convexities unarmed or with very minute granules.

Distribution.- Veracruz.
MEXICO: Veracruz: Lago Catemaco, 1-3-V-69, Bursera, D. E. Bright.

Notes. - The above treatment was based on the type series of 18 specimens.

## 188. Pityophthorus indigens Wood

Pityophthorus indigens Wood, 1976, Great Basin Nat. 36:361 (Holotype, female; 2 miles or 3 km W Armeria, Colima, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from nanus Wood by the much more feebly sulcate elytral declivity, by the very different frons in both sexes, and by other characters described below.

Female.- Length 1.2-1.4 mm, 2.7 times as long as wide; color yellowish brown.

Frons flattened to well above eyes, ascending slightly at epistomal margin; lateral margins abruptly angulate, separated from margin of eye by distance equal to width of two facets; surface smooth, shining, punctures fine, not close, uniformly distributed; vestiture of fine hair, those in central area of moderate length, those on margin twice as long, tips of longest setae on upper margin reach epistomal margin.

Pronotum 1.06 times as long as wide; essentially as in nanus except anterior margin more narrowly rounded, serrations more restricted to median area, punctures on posterior areas less numerous, slightly smaller.

Elytra 1.6 times as long as wide, 1.5 times as long as pronotum, essentially as in nanus except declivity more strongly convex, striae

1 narrowly, rather deeply impressed, punctures on 1 and 2 smaller, interstriae 2 narrower, ascending more abruptly laterally, 1 and 3 without granules.

Male.- Similar to female except shallowly, transversely impressed to upper level of eyes, its upper margin broadly, obtusely, subcarinate, surface rather coarsely, sparsely punctured, impressed area ornamented by sparse, very long hair.

Distribution.- Jalisco to Oaxaca.
MEXICO: Colima: 3 km W Armeria, $28-\mathrm{Vl}-65,70 \mathrm{~m}$. No. 129, Bursera, S. L. Wood. Jalisco: 21 km N Juchitlán, 2-VII-65, 1000 m , No. 180, Bursera, S. L. Wood. Oaxaca: 29 km W Niltepec, 23-V1-67, $30 \mathrm{~m}, \mathrm{No} .88$, Bursera, S. L. Wood.

Biology.- Specimens were taken from small dying branches on the living host tree.

Notes.- The above treatment was based on the type series of 12 specimens.

## 189. Pityophthorus burserae Wood

Pityophthorus burserae Wood, 1976, Great Basin Nat. 36:362 (Holotype, female; Atenquique, Jalisco, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from indigens Wood by the larger size, by the longer, more abundant vestiture on the female frons, and by other characters mentioned below.

Female.- Length $1.5-1.6 \mathrm{~mm}, 2.7$ times as long as wide; color yellowish brown.

Frons as in indigens except central area almost impunctate and glabrous, extending higher on vertex, marginal setae longer.

Pronotum and elytra essentially as in indigens except elytral declivity narrowly, more deeply sulcate, lateral convexities slightly higher than suture, interstriae setae on all declivital interstriae except upper twothirds of 2 .

Male.-Similar to female except frons as in male indigens.

Distribution.- Jalisco.
MEXICO: Jalisco: Atenquique, 24-V1-65, 1000 m , No. 114, Burscra, S. L. Wood; 21 km N Juchitlán, 2-VII-65, 1000 m , No. 180, Bursera, S. L. Wood.

Biology. - Specimens were taken from small, dying branches on living trees.

Notes.- The above treatment was based on the type series of six specimens.
190. Pityophthorus germanus Bright

Pityophthorus germanus Bright, 1976, Great Basin Nat. 36:4:34 (Holotype, male?: 154 km or 92 miles N Oaxaca, Oaxaca, Mexico; Canadian Nat. Coll. 15083)

Diagnosis.- The large size, the sparse, subconcentric pronotal asperities, and the strongly impressed declivity distinguish this species.

Male.- Length $2.7 \mathrm{~mm}, 2.6$ times as long as wide; color reddish brown.

Frons largely concealed by pronotum; lower half broadly convex, its surface smooth, shining, punctures rather fine, spaced by one to three diameters of a puncture, vestiture sparse, short, inconspicuous.

Pronotum 1.1 times as long as wide; widest near base, arcuately converging to constriction just behind rather narrowly rounded anterior margin; anterior margin armed by 12 coarse serrations; summit at middle; anterior slope with asperities rather sparse, obscurely subconcentric in arrangement; posterior area smooth, shining, with numerous impressed points; punctures moderately coarse, spaced by one to three diameters of a puncture.

Elytra 1.6 times as long as wide, 1.7 times as long as pronotum; sides straight and parallel on basal three-fourths, abruptly rounded, almost straight on median half behind; striae not impressed except 1 slightly, punctures rather small, close, in rows except 1 and 2 slightly staggered; interstriae twice as wide as striae, smooth, shining, impressed points obscure, a few punctures on posterior half except to base on 1. Declivity very steep, strongly impressed; striae 1 and 2 impressed to apex, punctures only slightly smaller than on disc; interstriae 1 distinctly elevated, armed by a row of tubercles, 2 as wide as 1 , flat, strongly impressed, smooth, shining, two or three small tubercles near apex, 3 abruptly, strongly elevated, a double or staggered row of tubercles on inner margin and slope, striae 3 and interstriae 4 on broadly rounded summit. Vestiture of fine, long, interstrial setae, shorter and stouter in impressed area of declivity.

## Distribution.- Oaxaca.

MEXICO: Oaxaca: 154 km N Oaxaca, 18-V-71, blacklight. D. E. Bright.

Notes.- The above treatment was based on the holotype.

## 191. Pityophthorus obtusipennis Blandford

Pityophthorus obtusipennis Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):240 (Lectotype, male; Balheu, Verapaz, Guatemala; British Mus. Nat. Hist., designated by Bright, 1976, Coleopt. Bull. 30:I84)
Diagnosis.- This unique species has the frons convex and without conspicuous vestiture or other features; the declivity is also unique as described below.
Female.- Length $1.5-2.0 \mathrm{~mm}, 2.6$ times as long as wide; color reddish brown.
Frons broadly convex, a slight transverse impression immediately above epistoma; surface smooth, shining, punctures coarse, deep, close; vestiture sparse, inconspicuous.

Pronotum 1.1 times as long as wide; widest on basal third, sides weakly arcuate, almost parallel on basal two-thirds, rather broadly rounded in front; anterior margin armed by about 12 serrations; summit at middle, distinct; anterior slope armed by about three subconcentric rows of asperities (variable, occasionally confused); posterior areas almost smooth, usually with impressed points, punctures fine to rather coarse, moderately close. Vestiture moderately abundant or restricted to margins and asperate areas, sparse.

Elytra 1.5 times as long as wide, 1.4 times as long as pronotum; sides almost straight and parallel on basal two-thirds, very broadly rounded behind; striae not impressed, punctures in rows, varying from small to moderately coarse; interstriae smooth, shining, once to twice as wide as striae, odd-numbered interstriae punctured at least on posterior third (often to base). Declivity steep, broadly impressed, sulcus between striae 2 extending to middle of elytra; striae 1 and 2 coarsely, deeply punctured; interstriae 1 weakly elevated, usually unarmed, less commonly with a few small granules, 2 as wide as 1 , distinctly impressed, impunctate, 3 rather strongly elevated, much higher than suture, reaching summit almost on striae 3 , armed by $6-8$ rather coarse serrations. Vestiture of fine, rather short strial hair, and interstrial setae on posterior half or more, mostly on oddnumbered interstriae.

Male.- Similar to female in all respects; vestiture evidently more abundant and longer.

Distribution.- Nayarit and Hidalgo to Guatemala.

MEXICO: Hidalgo: Jacala, I8-1-36, Pinus lawsonii, D. DeLeon. Michoacán: 33 km W Morelia, 16-VI-65, 2300 m, No. 62, Pinus, S. L. Wood; 29 km W Quiroga, 16-VI$65,2200 \mathrm{~m}$, No. 74, Pinus, S. L. Wood. GUATEMALA: Balhue, Verapaz.

Biology.- Specimens were taken from branches $2-6 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the syntypes and on 39 other specimens.

## 192. Pityophthorus euterpes Bright

Pityophthorus euterpes Bright. 1978, Creat Basin Nat. 38:75 (Holotype, male; 21 miles or 33 km W Lazardo Cárdenas, Chiapas, Mexico; Canadian Nat. Coll.)
Diagnosis.- This species is distinguished from obtusipennis Blandford by the smaller size, by the more slender body form, and by slight differences on the elytral declivity.

Female.- Length $1.5-1.8 \mathrm{~mm}, 2.8$ times as long as wide; color reddish brown.

Frons, pronotum, and elytra as in obtusipennis except lateral convexities of elytral declivity higher and usually more narrowly rounded (thinner).

Male-Similar to female except lateral convexities on declivity sometimes more broadly rounded (thicker).

Distribution.- Chiapas.
MEXICO: Chiapas: 33 km W Lazardo Cárdenas, 26-VI-69, Pinus ooearpa, D. E. Bright; Ocosingo Valley, 2-VII-50, L. V. Stannard.

Notes.- The above treatment was based on the type series of 10 specimens.

## 193. Pityophthorus occlusus Bright

Pityophthorus ocelusus Bright, 1976, Great Basin Nat. 36: 4.37 (Holotype, female; Yuscarán, Paraiso, Honduras: Wood Coll.)
Diagnosis.- This species is distinguished from obtusipennis Blandford by the smaller size, by the subaciculate frons, and by the slightly different elytral declivity as described below.

Female.- Length 1.3-1.6 mm, 2.7 times as long as wide; color yellowish to reddish brown.

Frons as in obtusipennis except subaciculate on lower half.

Pronotum as in obtusipennis except posterior areas very finely punctured (somewhat variable).

Elytra as in obtusipennis except declivity less strongly impressed, areas lateral to interstriae 3 on lower half usually somewhat flattened and usually armed by three or four small tubercles.

Male- Similar to female.
Distribution.- Nayarit to Honduras.
MEXICO: Nayarit: Laguna Santa María, 6-V11-65, 1000 m , No. 204, Pintus, S. L. Wood. Oaxaca: Nochixtlán, 17-V1-67, No. 56, Pinus, S. L. Wood. HONDURAS: Paraíso: San Lucas, 22-IV-64, 750 m , No. 524 , P. oocarpa, S. L. Wood; Yuscarán, 23-IV-6.4, 750 m , No. 519, P. oocarpa, S. L. Wood.

Notes. - The above treatment was based on the type series of 35 specimens.

## 194. Pityophthorus speciosus Wood

Pityophthorus speciosus Wood. 1977, Great Basin Nat. 37:215 (Holotype, female; 15 miles or 24 km S Valle Nacional, Oaxaca, Mexico; Canadian Nat. Coll.)
Diagnosis.- This species is distinguished from assitus Wood by the smooth, shining frons that is transversely impressed on its lower half and by differences on the pronotum and elytra as described below.

Female.- Length $1.7-2.0 \mathrm{~mm}, 2.5$ times as long as wide; color reddish brown.

Frons smooth, shining, punctures coarse, close, deep, transversely impressed from epistoma to slightly below upper level of eyes, upper area convex; vestiture short, inconspicuous.

Pronotum about as in assitus except transversely much more broadly arched, smooth, shining, with numerous, rather large, impressed points, punctures very small.

Elytra about as in assitus except surface smooth, brightly shining, declivital interstriae 2 strongly impressed and narrower.

Male.- Similar to female in all respects.
Distribution.- Oaxaca.
MEXICO: Oaxaca: 24 km S Valle Nacional, 20-V-71, 4000 ft , D. E. Bright; 147 km N Oaxaca, 18-V-71, blacklight, D. E. Bright.

Notes.- The above treatment was bsed on the type series of 10 specimens.

## 195. Pityophthorus assitus Wood

Pityophthorus assitus Wood, 1977, Great Basin Nat. 37:214 (Holotype, female; Lagos de Colores, Chiapas, Mexico; Canadian Nat. Coll.)

Diagnosis.- This species is distinguished from morosus Wood by the larger size, by the stouter body, by the strongly reticulate head and pronotum, and by the more strongly impressed declivital interstriae 2.

Female.- Length 1.9-2.2 mm, 2.6 times as long as wide; color dark brown.

Frons and pronotum as in morosus except strongly reticulate.

Elytra as in morosus except strial punctures smaller, not as deep, in slightly irregular rows, a few interstrial punctures present on posterior half of disc, declivital interstriae 2 more strongly impressed on its lateral half, strial setae slightly longer.

Male.- Similar to female in all respects.
Distribution.- Oaxaca to Chiapas.
MEXICO: Chiapas: Lagos des Colores, 17-V-69, D. E. Bright. Oaxaca: 24 km S Valle Nacional, 20-V-71, 4000 $\mathrm{ft}, \mathrm{D}$. E. Bright.

Notes.- The above treatment was based on 61 specimens in the type series and on 6 other specimens.

## 196. Pityophthorus morosus Wood

Pityophthorus morosus Wood, 1976, Great Basin Nat. 36:362 (Holotype, female; Zamorano, Morazán, Honduras; Wood Coll.)
Diagnosis.- This species is distinguished from paulus Wood by the distinctly, moderately arcuate sutures 1 and 2 of the antennal club, by the absence of a median callus on the vertex, and by other characters mentioned below.

Female.- Length $1.3-1.6 \mathrm{~mm}, 2.7$ times as long as wide; color very dark brown.

Frons broadly convex, a feeble, transverse impression in some specimens; surface smooth and shining on lower half, reticulate above, reticulation on vertex often transversely etched, punctures rather fine, never confluent, median callus feebly developed or absent; vestiture fine, sparse, short, inconspicuous. Antennal club conspicuously longer than scape; sutures 1 and 2 slightly arcuate.

Pronotum as in paulus except discal punctures much smaller, impressed points minute, less abundant; asperities varying from subconcentric to confused.

Elytra as in paulus except surface smoother, punctures much smaller, interstriae twice as wide as striae, impressed points on declivity less abundant and minute to absent, vestiture usually shorter, stouter.

Male.- Similar to female in all respects.
Distribution.- Veracruz to Honduras.
MEXICO: Chiapas: Ocozocoautla, Tapilula, Teopisca. Veracruz: 14 km E Huatusco, 7-VII-67, 250 m , No. 175, cut sapling, S. L. Wood. Guatemala: Volcán de Agua, 19-V-64, 1000 m , No. 601, woody vine, S. L. Wood. HONDURAS: Zamorano, Morazán, 18-IV-64, 700 m, No. 554, Eupatorium dalioides, S. L. Wood.

Biology.- The Huatusco series formed large nuptial chambers in the cambium region, from which as many as 18 short egg tunnels radiated. Twenty-two specimens were removed from one system of galleries, including several males. Collections of other series were represented only by brood; consequently, this mating habit could not be verified.

Notes. - The above treatment was based on the type series of 30 specimens and on 48 other specimens.

## 197. Pityophthorus borrichiae Wood

Pityophthorus borrichiae Wood, 1964, Great Basin Nat. 24:60 (Holotype, female; Key Largo, Florida; Wood Coll.)
Diagnosis.- This species is distinguished from paulus Wood by the smaller size, by the smaller antennal club, which is as short or shorter than the scape, by the smaller strial punctures, and by the shorter elytral setae.

Female.- Length $1.1-1.3 \mathrm{~mm}, 2.8$ times as long as wide; color very dark brown.

Frons as in paulus except surface smooth, shining, with punctures small, rather widely spaced. Antennal club smaller, usually shorter than scape.

Pronotum as in paulus except surface subreticulate, punctures smaller, asperities always in concentric rows.

Elytra as in paulus except surface of disc smooth, impressed points almost obsolete, strial punctures smaller, interstriae two to four times as wide as striae, vestiture fine, shorter, more nearly restricted to declivity.

Male.- Similar to female in all respects.
Distribution.- Florida.
USA: Florida: Key Largo, 25-VI-51, 2 m , Borrichia arborescens and B. frutescens. S. L. Wood.

Notes. - The above treatment was based on the type series of 32 specimens.

## 198. Pityophthorus paulus Wood

Pityophthorus paulus Wood, 1964, Great Basin Nat. 24:63 (Holotype, female; 24 miles NE Jacala, Hidalgo, Mexico; Wood Coll.)

Diagnosis.- This species is distinguished from morosus Wood by the straight sutures on the antennal club, by the presence of a conspicuous median frontal callus above the eyes, by the more coarsely punctured frons with many punctures confluent, and by the more slender, longer, elytral setae. The pronotal asperities may be either confused or subconcentric.

Female.- Length $1.4-1.8 \mathrm{~mm}, 2.9$ times as long as wide; color very dark brown.

Frons convex, with a conspicuous, impunctate, transversely etched, median callus from upper level of eyes to vertex, its lower extremity ending abruptly; surface transversly etched above, becoming subreticulate below to near epistoma, punctures coarse, close, many of them confluent; vestiture fine, short, inconspicuous. Antennal club moderately large, as long as or slightly longer than scape.

Pronotum 1.14 times as long as wide; outline as in nanus Wood; asperities on anterior slope varying from one or two concentric rows to entirely confused; posterior areas smooth, shining, impressed points large, very numerous, punctures coarse, deep. Vestiture as in namus.

Elytra 1.7 times as long as wide, 1.6 times as long as pronotum; sides almost straight and parallel on more than basal two-thirds, very broadly rounded behind; striae not impressed except 1 slightly near declivity, punctures moderately coarse, deep; interstriae shining, somewhat wrinkled, with numerous impressed points, varying from once to almost twice width of striae. Declivity steep, rather strongly bisulcate; striae 1 and 2 rather coarsely, deeply punctured; interstriae 1 moderately, abruptly elevated, armed by a sparse row of moderately large granules, 2 as wide as 1 , deeply impressed, smooth, shining, with impressed points and one or two setiferous punctures near apex, 3 rather strongly elevated, summit rather broadly convex, its mesal margin armed by a row of moderately small granules. Vestiture of rather fine, moderately long interstrial setae, mostly on or near declivity, except a few in lateral areas extend to base; less abundant on evennumbered interstriae.

Male.- Similar to female in all respects.
Distribution.- Chihuahua and Hidalgo to Chiapas.

MEXICO: Chiapas: Ocozocoantla, Tapilula, Teopisca. Chihuahua: Maguarichic. Hidalgo: Jacala, Pachuca. Michoacán: Carapan. San Luis Potosí: San Luis Potosí. Tlaxcala: Tlaxco.

Host.- Apparently Baccharus sp.
Notes. - The above treatment was based on the type series of 20 specimens and on 132 other specimens.

This species is somewhat variable, and it is possible that morosus and borrichiae are nothing more than well-marked geographical races of this form. Much more material from additional localities will be required for a proper evaluation of this complex.

## 199. Pityophthorus molestus Wood

Pityophthorus molestus Wood, 1976, Great Basin Nat. 36:362 (Holotype, female; Los Abritos, San Luis Potosí, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from lautus Eichhoff by the presence of a median frontal carina, by the more shallowly sulcate declivity, and by the longer elytral setae.

Female.- Length $1.3-1.5 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown.

Frons weakly convex, with a weak median carina from epistoma almost to upper level of eyes; surface shining, with indistinct fine lines and punctures, more coarsely punctured above eyes; vestiture of fine, short, sparse, hair.

Pronotum and elytral disc as in lautus. Elytral declivity as in lautus except interstriae 2 very slightly less strongly impressed, vestiture much longer.

Male.- Similar to female in all respects.
Distribution.- San Luis Potosí.
Mexico: San Luis Potosí: Los Abritos (east of Ciudad del Maiz), 18-V1-53, Liquidambar styraciflua, S. L. Wood.

Notes.- The above treatment was based on the type series of 14 specimens.

## 200. Pityophthorus lautus Eichhoff

Pityophthorus lautus Eichhoff, 1872, Berliner Ent. Zeitschr. 15:135 (Holotype, sex?; Americae boreali, apparently lost with Hamburg Mus.; Neotype, female; Morgantown, West Virginia; U.S. Nat. Mus., by Bright, 1976, Great Basin Nat. 36:427)
Pityophthorus rhois Swaine, 1917, Dom. Canada Dept. Agric. Ent. Br. Tech. Bull. 14(1):26 (Holotype. sex?; Ithaca, New York; Canadian Nat. Coll.,
1379); Bright, 1976, Great Basin Nat. 36:427. Synonymy
Pityophthorus natalis Blackman, 1921, Mississippi Agric. Expt. Sta. Tech. Bull. 10:8 (Lectotype, male?, Agricultural College, Mississippi; U.S. Nat. Mus., designated by Bright, 1976, Coleopt. Bull. 30:183): Bright. 1976, Great Basin Nat. 36:427. Synonymy
Pityophthorus rhois var. suainei Blackman, 1922, Mississippi Agric. Expt. Sta. Tech. Bull. 11:103 (Syntypes; Agricultural College and Wallerville, Mississippi: U.S. Nat. Mus.). No status
Pityophthorus rhois var. hamamelidus Blackman, 1928, New York St. Coll. For., Syracuse, Ted. Pul). 25:39 (Syntypes; Hancock Co., West Virginia; U.S. Nat. Mus.). No status

Pityophthorus thois var. acerini Blackman. 192s, New York St. Coll. For., Syracuse, Tech. Pub. 25:39 (Syntypes; Monongalia Co., West Virginia: U.S. Nat. Slus. No status
Diagnosis.- This species is distinguished from molestus Wood by the transversely impressed lower frons that lacks a median carina and by the shorter elytral vestiture.

Female. - Length 1.3-1.5 mm, 2.7 times as long as wide; color brown.

Frons broadly convex, transversely impressed on lower third, epistoma distinctly elevated; surface shining, closely, rather coarsely, deeply punctured; vestiture of fine, short, sparse hair.

Pronotum 1.1 times as long as wide; sides on basal half almost straight and parallel, rather broadly rounded in front; anterior margin armed by about 12 low serrations; summit at middle, distinct; asperities in subconcentric rows, not always clearly defined; posterior areas smooth, shining, with numerous impressed points, punctures rather coarse, deep, moderately close. Vestiture confined to sides and asperate area.

Elytra 1.7 times as long as wide, 1.6 times as long as pronotum; sides almost straight and parallel on basal two-thirds, very broadly rounded behind; striae not impressed except 1 slightly near declivity, punctures coarse, deep, close; interstriae as wide as striae, smooth, shining, impunctate except sparse punctures on 1 and at margin of declivity. Declivity steep, shallowly bisulcate; striae 1 and 2 rather coarsely, deeply punctured, 1 distinctly impressed; interstriae 1 abruptly, moderately elevated, with sparse, fine granules at summit, 2 as wide as 1 , moderately impressed, smooth, shining, impunctate, 3
convex, as high as 1 , with a row of fine granules. Vestiture largely confined to declivital area, of minute strial setae and moderately short interstrial setae, less abundant on evennumbered interstriae, absent on 2.

Male.- Similar to female except declivital sulcus slightly deeper.

Distribution.- Minnesota and Quebec to Kansas and Mississippi.

CANADA: Ontario: Prince Edward Co. Quebec: Ste. Annes, Wakefield. USA: District of Columbia: Washington. Indiana: Shoals. Kansas: Lawrence. Maine: Kittery Point. Maryland: Plummer's Island, University Park. Massachusetts: Springfield. Michigan: Detroit. Minnesota: Atkin, Houston Co., Winona Co. Mississippi: Starkville, Wallerville. Missouri: Union. New Jersey: Five-mile Beach, Red Bank. New York: Cranberry Lake, Green Lakes, Ithaca, Syracuse, Warrensbury, West Point. North Carolina: Boardman, Durham. Ohio: Pickaway Co. Pennsylvania: Essington, Hummelstown. Virginia: Falls Church. Vienna, Virginia Beach. West Virginia: Charleston, Hancock Co., Little Falls, Kanawha Co., Marion Co., Monongalia Co., Morgantown, Rosslyn. Wood Co.

Hosts.- Acer saccharum, Cercis canadensis, Hamamelis sp., Juglans nigra, Picea sp., Pinus strobus, Rhus typhina, R. radicans.

Biology.- Specimens were taken in stems $2-8 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the neotype of lautus, on the holotypes of rhois and natalis, on the specimens compared by Eggers to the type of lautus before the type was destroyed, on Blackman's series on which he based his morphological varieties, and on 537 other specimens. The varieties swainei, hamamelidis, and acerini were based on intrapopulational variants and, consequently, have no status in nomenclature.

## 201. Pityophthorus sambuci Blackman Fig. 200

Pityophthorus sambuci Blackman, 1942, Proc. U.S. Nat. Mus. 92:207 (Holotype, male?; Jalisco, Mexico; U.S. Nat. Mus., 55982)

Diagnosis.- This species is distinguished from diligens Wood by the more narrowly impressed declivity, with the lateral convexities more broadly rounded, by the weakly impressed lower frons that lacks a carina, and by other characters described below.

Female.- Length $1.3-1.4 \mathrm{~mm}, 2.6$ times as long as wide; color dark brown.

Frons broadly convex, a slight, transverse impression below upper level of eyes; surface
smooth, shining, rather coarsely punctured; vestiture short, sparse, inconspicuous.

Pronotum 1.03 times as long as wide; outline essentially as in lautus Eichhoff, except anterior margin armed by $8-10$ serrations; posterior areas weakly subreticulate, coarsely, deeply, rather closely punctured. Vestiture as in lautus, disc glabrous.

Elytra 1.6 times as long as wide, 1.5 times as long as pronotum; outline about as in lautus; striae not impressed, punctures in rows, moderately coarse, rather deep; interstriae one and one-half times as wide as striae; surface shining, irregular, obscurely reticulate in a few small areas, impunctate except near declivity. Declivity steep, rather shallowly bisulcate; striae 1 and 2 with punctures half as large as on disc; interstriae 1 rather weakly, abruptly elevated, sparsely, minutely punctured, 2 moderately impressed, one and one-half times as wide as 1 , very weakly reticulate, impunctate, 3 very slightly higher than 1 , rather broadly convex, with a row of punctures similar to those of striae. Vestiture confined to declivital areas on oddnumbered interstriae except one or two setae at base of declivity on 2 .

Male.-Similar to female except transverse frontal impression slightly stronger.

Distribution.- Jalisco.
MEXICO: Jalisco: state record, 29-IX-39, Sambucus branches. "Mexico at N.Y. 6-V-40."

Notes. - The above treatment was based on the holotype and on six paratypes.

## 202. Pityophthorus diligens Wood

Pityophthorus diligens Wood, 1976, Great Basin Nat. 36:363 (Holotype, female; 16 km or 10 miles E Pachuca, Hidalgo, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from sambuci Blackman by the more broadly impressed elytral declivity, with the lateral convexities more abruptly rounded, by the more strongly, more extensively impressed frons, and by other characters.

Female.- Length $1.3-1.5 \mathrm{~mm}, 2.8$ times as long as wide; color almost black.

Frons broadly convex, almost flat on median part of lower half, often with upper margin of impressed area abrupt or obscurely subcarinate; surface smooth, shining, rather finely punctured; vestiture short, sparse, inconspicuous.

Pronotum 1.15 times as long as wide; outline as in sambuci; anterior margin costate; posterior areas almost smooth, shining, very obscurely subreticulate, punctures rather fine, deep, not close. Vestiture as in sambuci, disc glabrous.

Elytra 1.8 times as long as wide, 1.6 times as long as pronotum; outline and dise about as in sambuci except strial punctures deeper, surface smoother, without any reticulation. Declivity steep, shallowly bisulcate; as in sambuci except punctures on striae 1 and 2 as large as on disc, appearing slightly more broadly impressed, with lateral convexities more abruptly rounded, more deeply impressed in some specimens; vestiture finer.

Male.-Similar to female except frons and declivital sulcus more distinctly impressed.

Distribution.- Hidalgo.
MEXICO: Hidalgo: 16 km E Pachuca, 10-VI-67, 2600 m, No. 186, desert shrub, S. L. Wood.

Notes.- The above treatment was based on the type series of 13 specimens.

## 203. Pityophthorus corruptus Wood

Pityophthorus corruptus Wood, 1976, Great Basin Nat. 36:363 (Holotype, female; Matamoros. Puebla, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from lautus Eichhoff by the larger size, by the different frons in both sexes, and by other minor differences described below.

Female.- Length $1.4-1.8 \mathrm{~mm}, 2.6$ times as long as wide; color reddish brown.

Frons plano-convex to upper level of eyes, more strongly convex above; surface almost smooth and shining on lower half, punctures moderately coarse, not close, becoming closely granulate-punctate above eyes; vestiture of rather sparse, almost uniformly distributed, moderately long hair.

Pronotum and elytra as in lautus except elytral declivity steeper, interstriae 2 more strongly impressed, interstriae 3 conspicuously higher than 1 .

Male.-Similar to female except lower half of frons moderately, transversely impressed, surface more coarsely punctured, vestiture short, inconspicuous.

Distribution.- Puebla.
MESICO: Puebla: 5 km or 3 miles $S$ Matamoros, 14 -VI-67, 2000 m , No. 34, Toxicodendron, S. L. Wood.

Brology.-Specimens were taken from a climbing poison ivy vine.

Notes.- The above treatment was based on the type series of 27 specimens.

## 204. Pityophthorus liquidambarus Blackman

Pityophthorus liquidambarus Blackman, 1921, Mis-
sissippi Agric. Expt. Sta. Tech. Bull. 10:14 (Lectotype, female: Mound, Louisiana; U.S. Nat. Mus., designated by Bright, 1976, Coleopt. Bull. 30:18.3)
Diagnosis.- This species is distinguished from lautus Eichhoff by the sexually dimorphic, very different frons and by the narrower elytral declivity that is not as steep on the lower half.

Female.- Length 1.3-1.5 mm, 2.7 times as long as wide; color yellowish brown.

Fig. 209. Protibiae of Corthylini spp.: 94, Conophthorus ponderosae; 95, Pityophthorus amplus; 96, Pityophthorus ramiperda; 97, Pityotrichus barbatus; 98, Pityophthorus nitidus ( $=$ anceps); 99, Pseudopityophthorus pubipennis; 100, Pityophthorus boycei; 101, Pityophthorus pinguus. (After Blackman 1928:179.)

Frons plano-convex from epistoma to well above eyes, lateral margins rather abruptly rounded; surface smooth, brightly shining, punctures very minute, sparse; vestiture very sparse and short in central area, long and rather sparse on lateral and dorsal margins.

Pronotum and elytra as in lautus except posterior third of elytra, including declivity, distinctly narrower, declivity not as steep on lower half; declivital vestiture finer, evidently less abundant.

Male.-Similar to female except frons transversely impressed on lower third, rather strongly convex above, coarsely, closely, deeply punctured; declivity slightly more strongly impressed.

Distribution.- Arkansas and West Virginia to Louisiana and Florida.

USA: Arkansas: Texarkana. Connecticut: Milford. Dis trict of Columbia: Washington. Florida: Haw Creek, Mariana, Monticello, Suwannee Springs. Georgia: Riceboro, Savannah. Louisiana: Mound. Mississippi: Corinth Fulton, Hattiesburg, Iuka, Meridian, Ripley, Starksville. North Carolina: Boardman, Chadbourn, Durham, Tryon. West Virginia: Charleston, Jackson Co.

Host.-Liquidambar styraciflua.
Biology.- Specimens were taken from limbs and boles 6-20 cm in diameter.

Notes. - The above treatment was based on the lectotype and on 229 other specimens.

## 205. Pityophthorus crinalis Blackman

Pityophthorus crinalis Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Pub. 25:41 (Holotype, female; Washington, D.C.; U.S. Nat. Mus., 41270)

Diagnosis.- This species is distinguished from lautus Eichhoff by the more slender body form, by the very different female frons, and by the slightly different elytral vestiture.

Female.- Length $1.3-1.5 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown.

Frons basically flat, a slight transverse impression on lower half, surface brilliantly shining, smooth, impunctate; dorsal margin with a dense fringe of long, yellow hair.

Pronotum (1.1 times as long as wide) and elytra ( 1.7 times as long as wide) essentially as in lautus except declivital vestiture slightly more abundant and present on all interstriae except 2 on face.

Male.-Similar to female except frons as in male liquidambarus.

Distribution.- Michigan and West Virginia to Indiana and Florida.

USA: District of Columbia: Washington. Florida: Haw Creek, Mariana. Indiana: Indianapolis. Kentucky: Barbourville. Maryland: Bladensburg. Michigan: Detroit. North Carolina: Fletcher. West Virginia: Jefferson Co., Kanawha Station.

Hosts.- Toxicodendron vernix.
Notes. - The above treatment was based on the holotype and on 102 other specimens.

## 206. Pityophthorus acuminatus (Schedl)

Neopityophthorus acuminatus Schedl, 1940, An. Esc. Nac. Cienc. Biol., Mexico 1:346 (Syntypes, female; Tuxtepec, Oaxaca and Finca la Florida, Chiapas; Schedl and Dampf colls.)
Diagnosis.- This species is distinguished from vesculus Wood by the dull, reticulate pronotum, with obscure punctures, by the more slender elytral setae, by the sparse inconspicuous female frontal vestiture, and by other characters.

Female.- Length $1.2-1.5 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown.

Frons evenly convex from eye to eye from slightly above epistoma to vertex, a distinct, transverse impression immediately above epistoma; surface reticulate on upper threefourths, smooth, shining below, punctures coarse, rather close; vestiture short, sparse, inconspicuous.

Pronotum 1.08 times as long as wide; sides almost subparallel on basal half, rather broadly rounded in front; anterior margin armed by about a dozen low, basally subcontiguous serrations; summit indefinite, slightly in front of middle; asperities on anterior half rather coarse, confused; posterior areas finely, strongly reticulate, punctures fine, shallow, somewhat obscure. Glabrous.

Elytra 1.6 times as long as wide, 1.5 times as long as pronotum; outline as in vesculus; striae not impressed, punctures fine, distinct, spaced by diameter of a puncture; interstriae three to four times as wide as striae, smooth, brightly shining, with moderately abundant impressed points, punctures absent except at base of declivity. Declivity steep, convex except narrowly, shallowly bisulcate; striae 1 impressed, punctures on all striae as on disc but slightly deeper; interstriae 1 slightly elevated, armed by a row of about 10 small granules, 2 as wide as 1 , with impressed points, no punctures, slightly impressed, 3
about as high as 1 , armed as on 1 . Vestiture confined to declivital interstriae except absent on 2, setae slender, about twice as long as distance between rows.

Male.- Similar to female in all respects.
Distribution. - Oaxaca to Honduras.
MExiCO: Chiapas: Finca La Florida. Oaxaca: Tuxtepec. Tabasco: 23 km or 14 miles W Cárdenas, 26-V1-67. 30 m , bark of $\log$, S. L. Wood. HONDURAS: La Ceiba, Atlántida, 29-V to 28-V1-49, at light, E. C. Becker.
Notes.- The above treatment was based on the syntypes of Schedl and on 21 other specimens.

## 207. Pityophthorus vesculus Wood

Pityophthorus vesculus Wood, 1978, Great Basin Nat. 38:40I (Holotype, female; Ft. Clayton, Canal Zone, Panama; Wood Coll.)
Diagnosis.- This species is distinguished from acuminatus (Schedl) by the smooth, shining, more coarsely punctured pronotum, by the much stouter, almost spatulate interstrial setae on the elytral declivity, and by the more abundant, much longer pubescence on the female frons.

Female.- Length $1.3-1.5 \mathrm{~mm}, 3.0$ times as long as wide; color reddish brown.

Frons flattened to well above eyes, margins rounded, separated from eye by distance equal to diameters of three facets; epistomal margin gradually, distinctly elevated; surface smooth, shining, densely, finely punctured; vestiture of fine, moderately abundant, uniformly distributed setae, little if any longer at margins. Eye normal, rather finely faceted.

Pronotum 1.2 times as long as wide; sides almost straight and parallel on basal twothirds, rather broadly rounded in front; anterior margin armed by about 12 low serrations; summit rather indefinite, anterior to middle; asperities on anterior slope confused; posterior areas smooth, shining, punctures moderately coarse, numerous impressed points present. Glabrous except on asperate area.

Elytra 1.8 times as long as wide, 1.5 times as long as pronotum; sides straight and parallel on basal two-thirds, rather strongly acuminate behind; striae not impressed, except 1 feebly, punctures rather coarse, close, deep; interstriae slightly wider than striae, smooth, shining, with a few obscure impressed points, impunctate except near declivity. Declivity
steep, shallowly bisulcate; striae 1 and 2 with punctures almost as coarse as on declivity; interstriae 1 distinctly elevated, granules minute, almost obsolete, 2 shallowly impressed, as wide as 1 , smooth, shining, impunctate, 3 as high as 1 , armed on upper half by two small, pointed tubercles. Vestiture confined to declivity, of stout, rather short, interstrial setae, absent on 2 .

Male.- Similar to female except frons convex, a slight transverse impression on lower third, surface smooth, shining, coarsely punctured, vestiture inconspicuous; declivital sulcus stronger, tubercles on interstriae 1 and 3 distinctly larger, declivital vestiture much stouter, almost spatulate.

Distribution.- Panama.
PANAMA: Ft. Clayton, Canal Zone, 22-XII-63, 30 m , No. 325 , bole 25 cm in diameter, S. L. Wood.

Notes.- The above treatment was based on the type series of five specimens.

## 208. Pityophthorus sparsepilosus (Schedl)

Gnathophorus sparsepilosus Schedl, 1935, Rev. de Ent. 5:343 (Syntypes, female; Hamburgfarm on Río Reventazón, Limón, Costa Rica; Schedl Coll.)
Diagnosis.- This species is distinguished from acuminatus (Schedl) by the larger size, by the shagreened pronotal disc, by the rounded elytral apex, by the abundant vestiture on the female frons, and by the very coarsely faceted eyes.

Female.- Length $1.5-1.7 \mathrm{~mm}, 3.2$ times as long as wide; color yellowish brown.

Frons rather narrow, almost flat on upper three-fourths, moderately ascending on lower fourth to epistomal margin; surface shining rather densely, very finely punctured on marginal areas, more sparsely punctured in central area; vestiture dense and rather long on lateral and upper margins, much shorter and rather sparse on central area, longest setae equal in length to half distance between eyes. Eyes large, very coarsely faceted.

Pronotum 1.3 times as long as wide; sides almost straight and parallel on more than basal half, rather narrowly rounded in front; anterior margin armed by about a dozen low, basally contiguous serrations; low summit well in front of middle; asperities on anterior slope rather small, confused; posterior areas shagreened, punctures small, shallow, not sharply impressed. Glabrous.

Elytra 2.0 times as long as wide, 1.9 times as long as pronotum; sides almost straight and parallel on more than basal two-thirds, rather broadly rounded behind; striae not impressed except 1 slightly, punctures moderately coarse, shallow; interstriae two to three times as wide as striae, smooth, shining, impressed points minute, obscure, punctures absent. Declivity rather steep, shallowly bisulcate; strial punctures smaller than on disc, striae 1 impressed; interstriae slightly shagreened, 1 distinctly elevated, with two or three punctures, 2 moderately impressed on mesal side, 2 as wide as 1 , impunctate, 3 as high as 1 , with a row of very fine punctures. Vestiture confined to odd-numbered declivital interstriae, sparse, rather stout.

Male.- Similar to female except frons weakly (transversely) convex, a distinct summit at upper level of eyes, surface smooth, shining, punctures coarse, close, vestiture short, sparse, inconspicuous; serrations on anterior margin of pronotum much larger in median area, punctures on dise rather coarse, longitudinally almost subaciculate; declivity more strongly, more broadly sulcate, tubercles on interstriae 1 and 3 (two or three on each) moderately coarse, pointed.

Distribution.- Costa Rica.
COSTA RICA: Hamburgfarm on Río Reventazón, Limón; Peralta, Cartago, $10-\mathrm{III}-64,500 \mathrm{~m}$, No. 465 , tree limb (Protium?), S. L. Wood.

Notes.- The above treatment was based on the Schedl syntypes and on eight other specimens. Because my specimens were associated in the same limb withCamptocerus aeneipennis, it is presumed the host was Protium.

## 209. Pityophthorus subsimilis Schedl

Pityophthorus subsimilis Schedl, 1955. Zeitschr. angew. Ent. 38:25 (Lectotype, male; G. Ciudad, Guatemala; Schedl Coll., designated by Bright, 1976)
Pityophthorus subimpressus Bright, 1976, Great Basin Nat. 36:441 (Holotype, female; 32 miles or 51 km S Valle Nacional, Oaxaca, Oaxaca; Canadian Nat. Coll.); Wood. 1977, Great Basin Nat. 37:210. Synonymy
Diagnosis.- This species is distinguished from delicatus Wood by the flat female frons, by the much narrower declivital sulcus, and by the (frequently) subconcentric arrangement of the pronotal asperities. It is probably
more closely related to attenuatus Blackman, but the host clearly distinguishes them.

Female.- Length $1.5-1.7 \mathrm{~mm}, 3.0$ times as long as wide; color brown.

Frons as in attenuatus except flattened area a bit more extensive, punctures slightly larger, vestiture moderately abundant, uniformly distributed, fine, very long (variable).

Pronotum as in attenuatus except asperities either confused or concentric (with all degrees of intermediacy represented), posterior areas smoother, usually obscurely shagreened.

Elytra as in attenuatus except declivital striae 2 much more distinctly punctured, interstriae 2 not as wide and impressed only at striae 1 , ascending laterally, interstriae 3 with punctures very feebly granulate, surface of declivity usually and disc occasionally shagreened.

Male. - Similar to female except frons transversely impressed from epistoma to upper level of eyes, a conspicuous transverse impression at its upper limit, surface smooth, shining, moderately punctured, vestiture inconspicuous; declivity distinctly more strongly impressed, granules on interstriae 3 slightly larger.

Distribution.- Puebla to Chiapas.
MEXICO: Chiapas: Lagos des Colores, 14-V1-69, D. E. Bright; 15 km SE Teopisca, 14-V-69, D. E. Bright. Oaxaca: 51 km S Valle Nacional, 21-V 71, Pimes, D. E. Bright. Puebla: 9 km NE Teziutlan, 2-VII-67, 1600 m , No. 153, Pinus, S. L. Wood.
Notes.- The above treatment was based on the lectotype of subsimilis and on the type series of 65 specimens of subimpressus.

## 210. Pityophthorus attenuatus Blackman

Pityophthorus attenuatus Blackman, 1942, Proc. U.S. Nat. Mus. 92:222 (Holotype,female; Mexico; U.S. Nat. Mus., 55996)
Pityophthorus pusillus Wood, 1964, Great Basin Nat. 24:62 (Holotype, female; 9 miles or 14 km S Zimapan, Hidalgo, Mexico; Wood Coll.): Wood, 1978. Great Basin Nat. 38:397. Synonymy

Diagnosis.- Among those species with the pronotal asperities arranged in concentric rows, this species is uniquely distinguished by the slender body form and the subacuminate elytral apex.

Female.-Length $1.2-1.5 \mathrm{~mm}, 3.0$ times as long as wide; color yellowish brown to brown.

Frons flattened on a rather small, semicircular area from epistoma to well above eyes, margins obtusely abrupt, separated from margin of eye by distance equal to width of four facets, epistomal margin slightly elevated; surface smooth, shining, finely, rather closely, uniformly punctured; vestiture very fine, uniformly distributed (sometimes appearing partly divided along median line), short, longest setae equal in length to less than one-fourth distance between eyes (Guatemalan series with slightly longer, more abundant setae). Antennal club small, sutures straight, 1 completely, 2 partly septate.

Pronotum 1.14 times as long as wide; sides almost straight and parallel on basal half, rather broadly rounded in front; anterior margin armed by 12-14 serrations; summit distinctly in front of middle; anterior slope with three concentric rows of asperities; posterior areas shining, usually smooth, limited reticulation sometimes present; punctures rather fine to moderately coarse (variable). Posterior half glabrous.
Elytra 1.9 times as long as wide, 1.7 times as long as pronotum; sides straight and parallel on basal two-thirds, rather strongly acuminate behind; striae not impressed, punctures moderately coarse, interstriae smooth, shining, as wide as striae, impunctate. Declivity rather steep, moderately bisulcate; striae 1 obsolete, 2 with minute punctures; interstriae 1 abruptly, moderately elevated, armed by a sparse row of fine granules, 2 twice as wide as 1 , rather strongly impressed but ascending slightly on its lateral half, 3 rather narrowly rounded and armed by about four small granules. Minute strial setae extend to base; oddnumbered interstriae on declivity, each with a sparse row of moderately long setae.

Male. - Similar to female except frons moderately convex to moderately, transversely impressed below upper level of eyes, upper margin of impression rounded to transversely subcarinate.

Distribution.- Jalisco and Veracruz to Guatemala.

MEXICO: Jalisco: Volcán Colima. Hidalgo: Zimapán. Michoacán: Quiroga. GUATEMALA: Guatemala City.

Host.- A composite shrub.

Notes.- The above treatment was based on the holotypes of attenuatus and pusillus and on 113 other specimens.

The holotype of subimpressus and the lectotype of subsimilis were compared to long series from southern Mexico that are almost or are entirely identical. Nevertheless, series of this form and of attenuatus are sufficiently variable that it is uncertain as to whether subsimilis and attenuatus represent anything more than geographical variants of one another. Much more material should be studied before this problem can be resolved.

## 211. Pityophthorus atomus Wood

Pityophthorts atomus Wood, 1964, Great Basin Nat. $24: 61$ Holotype, female; Veracruz, Veracruz, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from attenuatus Blandford by the smaller size and stouter form, by the steeper elytral declivity, with its apex rounded, and by other characters.

Female.- Length $0.8-1.1 \mathrm{~mm}, 2.7$ times as long as wide; color very dark brown.

Frons as in attenuatus except setae slightly longer, some at least equal to one-third distance between eyes.

Pronotum and elytral disc about as in attenuatus except impressed points usually more conspicuously present; pronotal punctures variable in size from rather fine to coarse within series. Declivity not as steep, not at all acuminate at sutural apex; striae 2 more coarsely punctured, interstriae 2 less deeply impressed; vestiture similar but stouter.

Male.-Similar to female except frons weakly convex with a weak transverse carina at upper level of eyes, surface rather coarsely punctured, vestiture short, inconspicuous.

Distribution.- Veracruz to Oaxaca.
MEXICO: Oaxaca: 184 km S Oaxaca. Veracruz: Veracruz, 30-VI-53, S. L. Wood; Cerro Gordo, 6-VII-67, 300 m. No. 164, shrub, S. L. Wood.

Biology. - Specimens were taken from a small, common, semiherbaceous shrub that grew on sand dunes at the beach on the southern limits of the city.

Notes.- The above treatment was based on the type series of 13 specimens.

# 212. Pityophthorus dimidiatus Blackman 

Pityophthorus dimidiatus Blackman, 1942, Proc. U.S. Nat. Mus. 92:221 (Holotype, female; Mexico; U.S. Nat. Mus., 55995)
Diagnosis.- This species is distinguished from perexiguus Wood by the different female frons as described below and by the more strongly sulcate elytral declivity, which is not as steep as in atomus Wood.

Female.- Length $1.2-1.3 \mathrm{~mm}, 2.8$ times as long as wide; color brown, elytra evidently lighter.

Frons as in attenuatus except flattened on a less extensive, narrower area (as in atomus except more finely punctured), vestiture as in atomus.

Pronotum as in attenuatus except strongly reticulate, punctures minute, shallow.

Elytra as in atomus except not quite as steep, sulcus slightly deeper, lateral convexities very slightly higher than suture, vestiture similar but finer.

Male.- Similar to female except shallowly, transversely impressed from epistoma to upper level of eyes, a weak transverse carina at upper level of eyes; setae on declivity short, stout (almost subspatulate).

Distribution.- "Mexico, 17-XI-38, Lot No. 38-17192" (intercepted at port of entry into the USA).

Notes.- The above treatment was based on the holotype, allotype, and one female paratype.

## 213. Pityophthorus timidus Blandford

Pityophthorus timidus Blandford, 1904, Biol. Centr. Amer. Coleopt. 4(6):241 (Holotype, female; Mexico, Salle Coll.; British Mus. Nat. Hist.)
The holotype fits my description of dimidiatus Blackman except that the vestiture on the female frons is shorter and perhaps less abundant, and the punctures on the pronotal disc apparently are larger. The holotype is 1.3 mm long and 2.9 times as long as wide. lt is suspected that they represent the same species, but additional material for study is needed. The differences between the types appear to be no greater than the variations seen within populations of allied species. These comments were based on the holotype of timidus and my notes on the type of dimidiatus.

## 214. Pityophthorus perexiguus Wood

Pitgophthorus perexiguns Wood, 1976, Great Basin Nat. 36:355 (Holotype, female; Dominical, Puntarenas, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from atomus Wood by the absence of a frontal carina in the male, by the steeper, more broadly impressed elytral declivity, and by other characters described below.

Female.- Length $1.0-1.4 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown.

Frons weakly, transversely impressed from epistoma to upper level of eyes, all margins rounded, surface smooth, shining, sparsely, finely punctured; margins at sides and above with sparse, moderately long hair.

Pronotum as in atomus except pronotal punctures smaller.

Elytra as in atomus except declivity steeper, more broadly impressed, striae 2 more coarsely punctured, interstriae 2 more broadly, more deeply impressed, 3 with granules slightly larger, declivital setae much stouter.

Male. - Similar to female except frons more strongly convex, transverse impression restricted to lower third, surface more coarsely, more closely punctured, without any long hair.

Distribution.- Costa Rica to Panama.
COSTA RICA: Cañas, Guanacaste, 13-VI-66, 50 m , No. 22, tree branch, S. L. Wood; Dominical, Puntarenas, $9-\mathrm{XII}-63,3 \mathrm{~m}$, No. 297 , tree branch, S. L. Wood. PANANA: Limón Bay, Canal Zone, 30-XII-63, 3 m , No. 353, tree limb, S. L. Wood.

Notes.- The above treatment was based on the type series of 48 specimens.

## 215. Pityophthorus nugalis Wood

Pityophthorus nugalis Wood, 1976, Great Basin Nat. 36:356 (Ilolotype, female; Volcán Pacaya, Esquintla, Guatemala: Wood Coll.)
Diagnosis.- This species is distinguished by the unique female frons, by the subacuminate apex of the elytra, and by other characters described below.

Female.- Length 1.2-1.3 mm, 3.1 times as long as wide; color brown.

Frons moderately convex, epistomal area produced on median half into a premandibular lobe; surface subreticulate, punctures fine below, moderately coarse near upper level of eyes; vestiture of fine, long, yellow hair confined to area below upper level of eyes; distributed into three areas, lateral areas from base of mandible to upper
level of eye, median fourth from apex of premandibular process to upper level of eyes. Antennal club small, oval; sutures 1 and 2 straight, indicated at margins by septa and setae; most of anterior face glabrous.

Pronotum 1.2 times as long as wide; sides on basal half straight and parallel, broadly rounded in front; anterior margin armed by about 14 coarse serrations; summit at middle; anterior slope armed by two concentric rows of asperities, others near summit confused; posterior areas smooth, shining, small areas of reticulation in lateral areas sometimes present, with numerous fine, impressed points, punctures rather small, moderately abundant. Vestiture inconspicuous, confined to asperate area and lateral margins.

Elytra 2.0 times as long as wide, 1.8 times as long as pronotum; sides almost straight and parallel on basal three-fourths, broadly rounded behind except sutural apex moderately acuminate; striae not impressed, punctures in rows, rather small, shallow; interstriae twice as wide as striae, smooth, shining, with numerous impressed points, an occasional puncture near declivity. Declivity rather steep, moderately bisulcate; striae 1 impressed, punctures not clearly evident, 2 with fine, distinct punctures; interstriae 1 moderately, abruptly elevated, armed by two to four very fine granules, 2 moderately impressed, more strongly on median side, as wide as 1 , with numerous impressed points, 3 as high as l, broadly rounded, armed by about two fine granules. Vestiture of minute strial hair on posterior half, and sparse, moderately long interstrial setae on odd-numbered interstriae, mostly on declivity.

Male.- Similar to female except frons convex, rather coarsely punctured, a fine, low, median carina, epistoma normal, vestiture sparse, inconspicuous; tubercles on elytral declivity distinctly larger.
Distribution.-Guatemala.
GUATEMALA: Volcán Pacaya, l-VI-64, 1300 m , No. 656 , woody vine 1 cm in diameter, S. L. Wood.

Notes.- The above treatment was based on the type series of six specimens.

## 216. Pityophthorus hermosus Wood

Pityophthorus hermosus Wood, 1976, Great Basin Nat. 36:356 (Holotype, female; Yuscarán, Paraíso, Honduras; Wood Coll.)

Diagnosis.- This species is distinguished from minutalis Wood by the long, abundant vestiture on the female frons, by the reticulate pronotum, and by other characters described below.

Female.- Length $1.0-1.3 \mathrm{~mm}, 2.7$ times as long as wide; color brown.

Frons flat from epistoma to vertex, lateral margins obtusely subangulate, separated from margin of eye by distance equal to width of two facets; surface obscured by dense brush of uniformly distributed long hair, marginal setae apparently slightly longer, longest setae equal in length to at least two-thirds distance between eyes.

Pronotum 1.13 times as long as wide; outline essentially as in nugalis Wood; first two rows of asperities usualy concentric, sometimes partly confused in median area; posterior areas strongly reticulate, punctures fine, moderately abundant. Vestiture confined to margins and asperate area, inconspicuous.

Elytra 1.7 times as long as wide, 1.5 times as long as pronotum; outline basically as in nugalis; striae not impressed, punctures moderately coarse, rather deep; interstriae smooth, shining, a few minute, impressed points present, as wide as striae, impunctate except at margin of declivity. Declivity steep, rather strongly bisulcate; as in nugalis except sulcus slightly deeper, lateral margins on basal half slightly higher than suture, tubercles on interstriae 3 conspicuously larger. Vestiture confined to declivity, on all interstriae except restricted to basal margin on 2, of moderate length.

Male.-Similar to female except frons transversely impressed from epistoma to upper level of eyes, transversely carinate at upper margin of impressed area, surface rather closely, finely punctured, pubescence of fine, short, moderately abundant hair.

Distribution.- Honduras.
HONDURAS: Yuscarán, Paraíso, 23-IV-64, 800 m , No. 517. Perymanium grande, S. L. Wood; Zamorano, Morazán, 18-IV-64, 700 m , No. 565, Eupatorium dalioides, S. L. Wood.

Notes.- The above treatment was based on the type series of 47 specimens.

## 217. Pityophthorus minutalis Wood

Pityophthorus minutalis Wood, 1976, Great Basin Nat. 36:357 (Holotype, female; Palín, Esquintla, Guatemala; Wood Coll.)

Diagnosis.- This species is distinguished by the small size and slender form, by the acuminate apex of the elytra, and by the distinctive frons as described below.

Female.- Length 0.9-1.0 mm, 3.2 times as long as wide; color brown.

Frons plano-convex from epistoma to well above upper level of eyes, lateral margins obtusely subangulate, separated from margin of eye by width of two facets; surface smooth, shining, finely, closely punctured; vestiture uniformly distributed, of almost uniform length, longest setae equal in length to onefourth distance between eyes.

Pronotum 1.2 times as long as wide; outline basically as in nugalis Wood, anterior slope with three concentric rows of asperities; posterior areas shining, almost smooth, punctures small, moderately close. Vestiture confined to lateral margins and asperate area, inconspicuous.

Elytra 2.0 times as long as wide, 1.8 times as long as pronotum; outline as in nugalis; striae not impressed, punctures small, deep, spaced within a row by twice diameter of a puncture; interstriae smooth, shining, impressed points sparse, a few weak, short, transverse lines, about one and one-half times as wide as striae, impunctate. Declivity steep, moderately bisulcate; as in nugalis except interstriae 2 without impressed points. Vestiture as in nugalis.

Male. - Similar to female except frons shallowly, transversely impressed to upper level of eyes, upper margin of impressed area forming a weak, transverse carina, surface of impressed area with indistinct, fine punctures, vestiture fine, sparse, short, inconspicuous.

Distribution.-Guatemala.
Guatemala: Palín, Esquintla, 19-V-64, 300 m , No. 587, shrub, S. L. Wood.

Notes.- The above treatment was based on the type series of 12 specimens.

## 218. Pityophthorus sobrinus Wood

Pityophthorus sobrinus Wood, 1976, Great Basin Nat. 36:357 (Holotype, female; 3 km SE Cartago, Cartago, Costa Rica; Wood Coll.)
Diagnosis.-This species is distinguished from minutalis Wood by characters on the frons and declivity as described below.

Female.- Length $1.5-1.7 \mathrm{~mm}, 3.0$ times as long as wide; color dark brown.

Frons flattened on slightly more than upper half, ascending below toward epistomal margin, lateral margins obtusely angulate, separated from margin of eye by width of two facets; surface smooth, shining, finely, rather closely punctured except impunctate on a small median area on lower third; vestiture of fine hair of moderate length in central area, much longer on margins, longest setae equal in length to slightly more than half distance between eyes.

Pronotum 1.18 times as long as wide; outline as in nugalis; anterior slope with three concentric rows of asperities (sometimes slightly confused), others confused near summit; posterior areas smooth, shining, with numerous impressed points, punctures fine, rather close. Vestiture confined to lateral margins and asperate area, inconspicuous.

Elytra 2.0 times as long as wide, 1.7 times as long as pronotum; outline about as in minutalis; striae not impressed, punctures coarse, deep, close; interstriae as wide as striae, shining, smooth, with minute impressed points, impunctate except 1 with a few punctures on posterior third. Declivity steep, shallowly bisulcate; not as steep as in minutalis, more broadly impressed; interstriae 2 with minute impressed points. Vestiture confined to declivity on odd-numbered interstriae, fine, rather sparse, of moderate length.

Male.-Similar to female except frons rather shallowly, transversely impressed from epistoma to upper level of eyes, its upper margin on median third marked by a subcarinate, transverse, impunctate elevation, surface smooth, shining, coarsely, rather closely punctured; declivital sulcus conspicuously deeper, tubercles slightly larger.

Distribution.- Costa Rica.
COSTA RICA: 3 km SE Cartago, Cartago, 2-vili-63, 1300 m, No. 99 , woody vine, S. L. Wood.

Notes.- The above treatment was based on the type series of 32 specimens.

## Genus PITYOTRICHUS Wood

Pityophilus Blackman, 1928 (nec Brulle, 1884). Bull. New York St. Coll. For., Syracuse, Tech. Pub. 24:147 (Type-species: Pityophihus barbatus Blackman, original designation)

Pityotrichus Wood, 1962, Great Basin Nat. 22:76 (Replacement name for Pityophilus Blackman)
Diagnosis.-As in Pityophthorus except pregula moderately enlarged and ornamented by a few long hairs in the male, enormously enlarged and ornamented by a large, dense tuft of hair in the female.

Description.- Length $1.4-1.8 \mathrm{~mm}, 2.5$ times as long as wide; color very dark brown.

Frons slightly dimorphic, somewhat more broadly impressed and more finely punctured in female. Antennae, pronotum, elytra, and legs as in Pityophthorus.

Distribution.- Arizona and New Mexico; two species are known.

Biology.- These monogamous species construct radiate tunnels in the phloem tissues without engraving the wood. The egg galleries are short, and the number of offspring produced by each pair is small. Shaded out twigs and small branches on living trees are selected for attack.

Notes.- This genus is recognized as distinct from Pityophthorus on the basis of the unique pregula and biology that do not appear to intergrade. There is some question as to the validity of this action. Perhaps future collecting will determine whether or not continued generic recognition is justified.

## Key to the Species of Pityotrichus

1. Male frons without a carina; interstrial setae present on all interstriae and twothirds as long as distance between rows, at least twice as long as those of striae; Arizona and New Mexico; Pinus edulis: 1.3-1.6 mm $\qquad$ 1. barbatus (Blackman)

- Male frons armed by a median carina from epistoma almost to upper level of eyes; interstrial setae less than one-third as long as width of an interstriae, about equal in length to strial setae, except mostly absent on even-numbered interstriae; Arizona and New Mexico; Pinus strobiformis; 1.6-1.8 mm

2. hesperius Bright

## 1. Pityotrichus barbatus (Blackman)

Figs. 208-209
Pityophilus barbatus Blackman, 1928, Bull. New York St. Coll. For., Syracuse, Tech. Pub. 25:147 (Holotype, female; Las Vegas Hot Springs, New Mexico: U.S. Nat. Mus., 41328)
Diagnosis.- This species is distinguished from hesperius Bright by characters summarized in the above key.

Female.- Length 1.3-1.6 mm, 2.5 times as long as wide; color very dark brown.

Frons basically convex, except median third flattened to feebly concave; surface shining, punctures fine, variable in size, moderately abundant; vestiture fine, rather sparse, moderately long on marginal areas, very short on impressed area; pregula greatly enlarged, ornamented by a dense brush of very long, yellow hair. Antennal club slightly longer than scape, 1.1 times as long as wide; sutures 1 and 2 septate, moderately procurved.

Pronotum 1.0 times as long as wide; widest on basal third, sides rather weakly arcuate on basal half, moderately rounded in front; anterior margin armed by six rather coarse serra-
tions; summit at middle, a distinct, transverse impression behind summit; anterior slope rather coarsely asperate; posterior areas smooth, shining, punctures moderately coarse, deep, close, interspaces usually narrower than diameter of a puncture. Vestiture confined to sides and asperate area.

Elytra 1.5 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal two-thirds, rather broadly rounded behind; striae not impressed, punctures fine, in rows on posterior half of disc, slightly confused on basal half, spaced by two to three diameters of a puncture; interstriae smooth, shining, four to six times as wide as striae, punctures similar to those of striae, rather widely spaced. Declivity convex, moderately steep, strial punctures minute, almost obsolete; interstriae 1 weakly elevated, 2 shallowly, broadly impressed, 3 as high as 1 , 1 and 3 each with a row of very fine granules. Vestiture of rows of fine, short, strial hair and of rows of interstrial setae, each seta about two-thirds as long as distance between rows, twice as long as those of striae, absent on declivital interstriae 2.

Male.- Similar to female except frons more broadly flattened, pregula less strongly enlarged, ornamented by less than a dozen long hairs.

Distribution.- Arizona and New Mexico.
USA: Arizona: Chiricahua Mts., Ash Canyon in Huachuca Mts. New Mexico: Capitan, Cloudcroft, Las Vegas Hot Springs, Lake Nogal, Meek.

Hosts.-Pinus cembroides, P. edulis.
Brology.- As described for the genus.
Notes. - The above treatment was based on the holotype and on 67 other specimens.

## 2. Pityotrichus hesperius Bright

Pityotrichus hesperius Bright, 1971, Pan Pacific Ent. 47:69 (Holotype, female; Pinaleno Mts., Graham Co., Arizona; Canadian Nat. Coll., 11445)
Diagnosis.- This species is distinguished from barbatus (Blackman) by characters summarized in the above key.

Female.- Length $1.6-1.8 \mathrm{~mm}, 2.5$ times as long as wide; color very dark brown.

Frons as in barbatus except central area more distinctly impressed, setae of almost uniform, medium length.

Pronotum and elytra as in barbatus except surface weakly reticulate, interstrial punctures and setae largely obsolete on even-numbered interstriae, and interstrial setae much shorter, usually not longer than those of striae, length of none of them greater than one-third width of an interstriae.

Male. - Similar to female except frons more broadly impressed, with a rather sharply elevated, low, median carina from epistoma almost to upper level of eyes.

Distribution.- Arizona and New Mexico.
USA: Arizona: Pinaleno Mts. in Graham Co., 15-VII68, Pillus strobiformis, D. E. Bright. New Mexico: Cloudcroft Ski Area, 4-VI-69, 2800 m , No. 52, P. strobiformis, S. L. Wood; Sandia Peak, Bernalillo Co., 9-VII68, P. flexilis, D. E. Bright.

Host.- Pinus flexilis, P. strobiformis.
Notes.- The above treatment was based on two topotypic paratypes and on 24 other specimens. The holotype was also examined.

## Genus GNATHOLEPTUS Blackman

Gnatholeptus Blackman, 1943, J. Washington Acad. Sci. 33:34 (Type-species: Gnatholeptus mandibularis Blackman $=$ Pityophthorus shannoni Blackman, original designation)
Diagnosis.- This genus is not clearly defined and eventually may be combined with Pityophthorus. It is distinguished from Pi tyophthorus by the slightly to enormously elongated female mandibles, by the very coarsely faceted eyes, and by other characters cited below.

Description.- Length 1.3-1.8 mm, 2.8-3.0 times as long as wide; color yellowish brown.

Frons sexually dimorphic, male convex, with mandibles normal, female somewhat flattened or variously impressed, with or without vestiture, with mandibles slightly to enormously elongate. Antenna as in Pityophthorus. Pronotum with summit rather indefinite, lateral margin usually not marked by a fine, raised line. Elytra finely sculptured, about as in Pityophthorus, declivity bisulcate, declivital interstriae 3 usually armed in male. Legs as in Pityophthorus.

Distribution.-Costa Rica to northern South America; four species have been assigned to this genus, all occur in Central America.

Biology. - These polygamous species form radiate gallery systems as in most Pityophthorus. The hosts most commonly are of the genus Protium, but those of certain other genera are acceptable.

Notes.- A majority of the South American species at hand that are assignable to this genus have not been named. They are allied to subcribratus Schedl and do not exhibit the remarkable female mandibular character. AIthough this group of species is distinctive, it is doubtful that generic rank is justified.

## Key to the Species of Gnatholeptus

1. Discal interstriae with numerous, minute punctures; pronotal asperities confused; hair on female frons abundant, long; female mandibles almost normal; Nicaragua to Panama; $1.4-1.8 \mathrm{~mm}$ 1. subcribratus (Schedl)

- Discal interstriae impunctate; pronotal asperities mostly in concentric rows; female mandibles moderately to enormously elongate; vestiture on female frons shorter, less abundant

2(1). Female without a premandibular epistomal lobe; female frons with moderately long, rather abundant vestiture extending to upper level of eyes; female declivital interstriae 3 armed as in male, 1 unarmed in both sexes; female mandible distinctly shorter than protibia; Panama to Colombia; Dacreoides; 1.3-1.6 mm . 2. shannoni (Blackman)

- Female with conspicuous median premandibular epistomal lobe; female frons with vestiture restricted to lower half or absent; female elytral declivity unarmed; female mandible conspicuously longer than protibia
3(2). Female premandibular process slender, almost pointed, equal in width to about two facets of eye, about three facets in length; female mandibles slender, sickle-shaped, omamented on lateral face near base by a tuft of hair; declivital interstriae 2 twice as wide as 1 in both sexes, 1 with a row of tubercles in male; Costa Rica and Panama; 1.3-1.5 mm

3. panameñsis Blackman

- Female premandibular process subquadrate, equal in width to about three facets, about six facets in length, widest near apex, apical half conspicuously ornamented by long hair; female mandibles very large, elongate, not ornamented by long hair; declivital interstriae 2 as wide as 1 in both sexes, 1 unarmed in male; Costa Rica to Colombia and Surinam; Protium, Cedrella; 1.4-1.8 mm ......

4. semiermis (Nunberg)

## 1. Gnatholeptus subcribratus (Schedl)

Pityophthorus subcribratus Schedl, 1937, Arch. Inst. Biol. Veget. Río de Janeiro 3:168 (Holotype, female: Hamburgfarm on Río Reventazón, Limón, Costa Rica; Schedl Coll.)
Gnatholeptus subcribratus: Bright, 1977, Canadian Ent. 109:51.3
Pityophthorus zeteki Blackman, 1942, Proc. U.S. Nat. Mus. 92:226 (Holotype, female; Trinidad River, Panama; U.S. Nat. Mus., 56014); Bright, 1977, Canadian Ent. 109:513. Synonymy
Diagnosis.- This species is distinguished from other species in this genus by the confused pronotal asperities, by the punctured interstriae, and by the female frons and mandibles as described below.

Female.- Length $1.4-1.8 \mathrm{~mm}, 3.0$ times as long as wide; color yellowish to light reddish brown.

Frons almost flat from eye to eye from epistoma to slightly above eyes; surface almost smooth, very closely, rather finely punctured; vestiture of abundant, long, yellow hair, longer above, longest dorsal setae exceeding epistomal margin; epistomal margin almost straight, without a median lobe; mandibles normal, very slightly elongate. Antennal club as long as scape, sutures 1 and 2 straight, septate except on middle third.

Pronotum 1.15 times as long as wide; sides almost straight and parallel on basal half, very broadly rounded in front; anterior margin armed by 14 low serrations; summit
slightly anterior to middle; anterior slope with fine, confused asperities; posterior areas almost smooth, punctures rather fine, shallow, on disc with fine and very fine punctures intermixed. Glabrous except in asperate area.

Elytra 1.7 times as long as wide, 1.5 times as long as pronotum; sides straight and parallel on basal two-thirds, subacutely acuminate behind; striae I weakly, others not impressed, punctures moderately coarse, rather deep, close; interstriae smooth, shining, almost twice as wide as striae, punctures minute, rather abundant, confused. Declivity very steep, convex; striae as on disc; interstriae 1 and 3 very slightly elevated, 1 with about four minute granules, 3 with two or three pointed denticles; apex rather strongly acuminate. Vestiture confined to declivity, of rather coarse, close interstrial bristles, each bristle about one and one-half times as long as distance between rows.

Male. - Similar to female except mandibles normal, frons convex, more coarsely, deeply punctured, with vestiture sparse, short, inconspicuous; declivital interstriae 2 more distinctly impressed, narrower than 1 , denticles on 3 distinctly larger, one or more smaller denticles also on 5 and 7; declivital vestiture stouter, absent on interstriae 2.

Distribution.- Nicaragua to Panama.

NICARAGUA: Intercepted in cachimbo wood from Nicaragua at Valparaiso, Chile, 27-IX-45. COSTA RICA: Pandora, Limón, 23-VIll-63, 50 m , No. 137, limb, S. L. Wood; Hamburgfarm on Río Reventazón, Limón, 25-VIII-25, F. Nevermann. PANAMA: Limón Bay, Canal Zone, 30-XII-63, 3 m , No. 352, log (Protium?), S. L. Wood; Trinidad River, 2, 4-V-12, A. Busck; Alhajuelo, 5-IV-11, A. Busck.

Biology. - As mentioned for the genus.
Notes.- The above treatment was based on the holotypes of subcribratus and zeteki and on 62 other specimens.

## 2. Gnatholeptus shannoni (Blackman) Fig. 210

Pityophthorus shannoni Blackman, 1942, Proc. U.S. Nat. Mus. 92:224 (Holotype, female; Cano Saddle at Gatún Lake, Panama; U.S. Nat. Mus., 56015)
Gnatholeptus mandibularis Blackman, 1943. J. Washington Acad. Sci. 33:34 (Holotype, female: Barro Colorado Island, Canal Zone, Panama: U.S. Nat. Mus., 56418); Wood, 1979, Great Basin Nat. 39:134. Synonymy
Pityophthorus gentilis Schedl, 1961, Pan Pacific Ent. 37:225 (Holotype, male; Barro Colorado Island, Gatún Lake, Canal Zone, Panama; Cornell Univ.): Bright, 1977, Canadian Ent. 109:513 and Wood, 1979, Great Basin Nat. 39:134. Synonymy
Diagnosis.- This species is distinguished from panamensis Blackman by the absence of a median epistomal lobe in the female, by the armed female elytral declivity, and by other
characters cited in the above key and in the following description.

Female.- Length $1.3-1.6 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown.

Frons flattened on slightly more than median half from epistoma to upper level of eyes; surface shining, very finely punctured; surface ornamented by abundant, uniformly distributed, moderately long setae of uniform length. Mandibles distinctly longer than normal. Antennal club as in subcribratus (Schedl) except sutures more distinctly procurved.

Pronotum outline as in subcribratus; asperities arranged in subconcentric rows, less definite near summit; summit distinctly anterior to middle; posterior areas weakly reticulate, punctures very fine, shallow, moderately close. Glabrous except on asperate area.

Elytra outline as in subcribratus except sutural apex less strongly acuminate; striae not impressed, punctures in indefinite rows; moderately coarse, close; interstriae smooth, shining, almost twice as wide as striae, impunctate except near declivity. Declivity very steep, shallowly sulcate; striae about as on disc, punctures slightly smaller; interstriae 1 distinctly, rather weakly elevated, unarmed, 2 as wide as 1 , moderately impressed, 3 higher than 1, armed on middle half by two

Fig. 210. Gnatholeptus spp., female heads: a, panamensis; b, shannoni; c, semiermis.
moderately coarse denticles, a third smaller denticle at junction of 3 and 7. Vestiture confined to declivity, similar to subcribratus except very short on 1 , absent on 2 .

Male.- Similar to female except mandibles normal, frons more nearly convex, more coarsely punctured, vestiture sparse, short, inconspicuous; declivital setae stouter.

Distribution. - Panama to Colombia.
PANAMA: Barro Colorado Island, Canal Zone, 27 -Xil-63. $70 \mathrm{~m}, \mathrm{No}$. 3.37. limb, S. L. Wood; Cano Saddle at Gatín Lake; Madden Forest, Canal Zone, 2-1-64, 70 m , No. 367, limb S. L. Wood. OTHER COUNTRIES: Colombia.

Biology.-As described for the genus.
Notes. - The above treatment was based on the holotypes of shannoni, mandibularis, and gentilis and on 61 other specimens.

## 3. Gnatholeptus panamensis Blackman

 Fig. 210Gnatholeptus panamensis Blackman, 1943, J. Washington Acad. Sci. 33:35 (Holotype, female; Barro Colorado 1sland, Canal Zone, Panama; U.S. Nat. Mus., 56419)
Pityophthons epistomalis Schedl, 196I, Pan Pacific Ent. 37:22.4 (Holotype, female; Barro Colorado Island, Canal Zone, Panama: Cornell University); W'ood, 1979. Great Basin Nat. 39: I34. Synonymy

Diagnosis.- This species is distinguished from semiermis (Nunberg) by the very different female frons and mandibles as described below, by the much wider declivital interstriae 3 , and by the other characters cited below.

Female.- Length 1.3-1.5 mm, 3.0 times as long as wide; color yellowish brown.

Frons convex, gradually, transversely impressed toward epistoma, impunctate on lower half, a few fine punctures above; vestiture sparse, minute; epistomal margin on median sixth bearing a premandibular lobe, lobe equal in width to one or two facets, length about equal to three facets of eye, narrower at apex than at base, apex usually bearing a few short setae. Mandibles slender, elongate, sickle-shaped, ornamented on anterolateral face by a conspicuous tuft of setae.

Pronotum as in shannoni (Blackman) except posterior areas not reticulate, minute impressed points present.

Elytra much as in shannoni except strial punctures distinctly larger, in definite rows, interstriae only slightly wider than striae,
with minute impressed points, declivity weakly bisulcate, all interstriae unarmed; interstriae 2 twice as wide as 1 . Odd-numbered interstriae each with about two to six slender bristles.

Male. - Similar to female except frons convex, finely punctured throughout, epistoma and mandibles normal, declivital interstriae 1 armed by three or four small, pointed granules, 2 more strongly impressed, 3 weakly elevated and armed by denticles as in shannoni.

Distribution.- Costa Rica to Panama and Surinam.

COSTA RICA: Río Damitas, Dota Mits., 18-11-64, 250 m, No. 439, tree branch, S. L. Wood. PANAMA: Barro Colorado 1sland, Canal Zone, 20-V1-41, at light, J. Zetek, also 26-1II-24; Tres Rios Plantation, Gatún Lake, 1931, T. O. Tschokke. OTHER COUNTRIES: Surinam.

Biology. - Habits are as described for the genus.

Notes.- The above treatment was based on the holotypes of panamensis and epistomalis and on 29 other specimens.

## 4. Gnatholeptus semiermis (Nunberg)

 Fig. 210Pityophthorus semiermis Nunberg, 1963, Trans. Wisconsin Acad. Sci. 52:98 (Holotype, male; Finca La Lola, Limón, Costa Rica; Univ. Wisconsin)
Gnatholeptus semiermis: Bright, 1977, Canadian Ent. 109:513
Diagnosls.- This species is distinguished from panamensis Blackman by the very large female epistomal lobe and mandibles, by the narrow declivital interstriae 2, and by other characters cited below.

Female.- Length $1.4-1.8 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown.

Frons strongly, transversely impressed to epistomal margin on lower two-thrids of area below upper level of eyes, upper area strongly convex; surface almost smooth, impressed area finely, rather closely punctured; impressed area with moderately abundant, fine, short, rather inconspicuous setae; epistoma with an enormous subquadrate, premandibular, median lobe, its base equal in width to twice diameter of a facet of eye, its apex three times width of a facet, its length six times diameter of a facet, ornamented on its apical half by numerous very long subplumose setae. Mandibles enormously elongate, not ornamented by setae. Antennal club
obovate, 1.3 times as long as scape, 1.3 times as long as wide; sutures moderately procurved.

Pronotum essentially as in shannoni (Blackman) except posterior areas smooth, shining.

Elytra essentially as in panamensis; strial punctures smaller, moderately confused; declivity with strial punctures minute, striae 1 impressed, interstriae 1 distinctly, weakly elevated, 2 not wider than 1, median side impressed, ascending laterally to rounded summit on 3,3 higher than 1,3 with sparse punctures. Vestiture confined to declivity, of two to four fine bristles on each of odd-numbered interstriae.

Male.-Similar to female except frons shallowly, transversely impressed, a distinct subcarinate median elevation at upper level of eyes, epistoma normal, slightly elevated toward margin, premandibular lobe absent; declivital interstriae 3 with one to three pointed granules.
Distribution.- Costa Rica and Colombia to Surinam.

COSTA RICA: Peralta, Cartago, $10-\mathrm{III}-64,50 \mathrm{~m}$, No. 465 , Protium, S. L. Wood; Río Damitas, Dota Mts., 18 -II-64, 250 m , No. 439, tree branch, S. L. Wood; Finca La Lola, Limón. OTHER COUNTRIES: Colombia, Surinam, Venezuela.

Hosts.- Protium probably copal.
Biology.- As described for the genus.
Notes.- The above treatment was based on the holotype and on 94 other specimens.

Several attempts were made to observe female boring activity. In spite of the inefficient, cumbersome appearance of their mandibles, they appear to excavate their tunnels at least as quickly as other species with normal mandibles.

## Genus PITYOBORUS Blackman

Pityoborus Blackman, 1922, Mississippi Agric. Expt. Sta. Tech. Bull. 11:96 (Type-species: Crypturgus comatus Zimmermann, monobasic); Wood, 1958, Great Basin Nat. 28:45-56 (Revision)
Diagnosis.- This genus is distinguished from allied genera by the densely pubescent anterolateral areas of the female pronotum, by the absence of basal and lateral raised margins of the pronotum (obscurely developed in secondus), by the comparatively large antennal club, by the fine, conservative
sculpture, by the monogamous habit, and by the distinctive gallery system.

Description.- Length $1.5-3.2 \mathrm{~mm}$, 2.5-2.8 times as long as wide; color light yellowish brown to dark reddish brown.

Frons dimorphic, male moderately convex to feebly concave, with sparse to moderately abundant vestiture, female flat to rather strongly concave, with modest to elaborate ornamental vestiture. Eye emarginate. Antennal scape elongate; funicle 5 -segmented; club rather large, twice as long as funicle, sutures 1 and 2 septate. Pronotum 0.9-1.0 times as long as wide; summit at middle, without a transverse impression posterior to summit; anterior margin armed by 12-18 serrations; anterior slope moderately asperate; posterior areas reticulate, rather finely to minutely punctured; basal and lateral margins rounded except obscurely marked by a fine raised line in one species; large anterolateral areas in female ornamented by dense, fine, moderately long pubescence. Elytra finely sculptured, strial punctures in rows or not, rather fine to minute; interstrial punctures usually reduced in number; declivity convex, moderately steep, conservative sculpture variable. Vestiture hairlike; comparatively sparse.

Distribution.- Utah and North Carolina to Honduras; seven species are known.

Biology.- These monogamous species attack the shaded out branches $2-8 \mathrm{~cm}$ in diameter of healthy, standing trees of the genus Pinus. The gallery system engraves the wood deeply and consists of a nuptial chamber formed by the male and two transverse egg galleries formed by the female. In small branches the egg galleries tend to spiral slightly to avoid overlap. Egg niches are not always present. Each of the small number of larvae excavates a small chamber parallel to the grain of wood at least large enough to accommodate its adult body but never longer than 12 mm . The larvae and young adults may move in and out of these larval cradles and are commonly found in the egg gallery. There is no evidence of mycelial growth, although the short larval mines strongly suggest a symbiotic relationship. In addition to these tunnels, the parental adults and later the newly matured brood often form feeding tunnels that radiate from the nuptial chamber more or less parallel to the grain of the wood. In secondus these feeding tunnels may
exceed twice the combined lengths of the two egg galleries. The number of offspring produced by one pair rarely exceeds 20 and
usually is less than 7. Because they accelerate the natural pruning of healthy trees, their economic effect probably is beneficial.

## Key to the Species of Pityoborus <br> (Modified from Wood 1958)

1. Female frons flat or weakly impressed on a narrow median area, its margins ornamented by a sparse row of setae only slightly longer than those of central area; elytral striae often weakly impressed, punctures in definite rows; male frons never with a conspicuous brush of hair

- Female frons concave from eye to eye, its margins ornamented by a dense row of long, curved setae; elytral striae never impressed, punctures on 1 and 2 confused or at least very irregular (if doubtful then male frons with frontal vestiture as in female)

2(1). Smaller; elytral surface minutely irregular but not reticulate; elytral declivity more narrowly convex, interstriae 2 not impressed, granules very minute if evident; pubescent areas on female pronotum comparatively small; Mississippi and North Carolina to Florida; $1.5-2.0 \mathrm{~mm}$ 1. comatus (Zimmermann)

- Larger; elytral surface finely, uniformly reticulate; elytral declivity more broadly convex, interstriae 2 feebly to moderately impressed, granules on 1 and 3 clearly evident; a variable species, both within and between series; Utah and New Mexico to Puebla and Veracruz; 1.8-2.7 mm 2. secundus Blackman

3(1). Declivital interstriae 2 moderately impressed, impunctate, and devoid of erect setae, 1 and 3 armed by moderately coarse granules; strial punctures on disc larger, more strongly confused, interstrial punctures more numerous; larger species4

- Declivital interstriae 2 feebly if at all impressed, with a row of fine punctures or granules and bearing a row of erect setae as on 1 and 3,1 and 3 feebly or not at all granulate; strial punctures on dise smaller and more nearly in rows, interstrial punctures less numerous; smaller species5

4(3). Discal surface of elytra usually obscurely reticulate, rarely with iffpressed points, strial punctures larger, interstriae about three to four times as wide as diameter of a puncture; female frons less strongly concave, setae on margins yellow, shorter, evidently less numerous; male frons usually without median elevation; Durango to Jalisco; 2.9-3.2 mm
3. hirtellus Wood

- Discal surface of elytra smoother, with minute impressed points, punctures smaller, interstriae about six times as wide as striae; female frons more strongly concave, setae on margins reddish, longer, more numerous; male frons with a weak median carina; Chihuahua and Michoacán to Veracruz and Puebla; $2.8-3.2 \mathrm{~mm}$

4. rubentis Wood

5(3). Male frons weakly convex, vestiture rather sparse, shorter, uniformly distributed; declivital interstriae 2 feebly impressed, 1 and 3 armed by fine granules; Honduras to British Honduras; 1.8-2.1 mm
5. hondurensis Wood

- Male frons flat to weakly concave, vestiture largely confined to margins, longer, declivital interstriae 2 not impressed, 1 and 2 unarmed or granules not larger than those on 2
6(5). Strial punctures on declivity small, deep, interstriae about one-fourth as wide as striae; female frons more deeply concave, vestiture finer, pale yellow; Oaxaca; 2.0 mm

6. frontalis Wood

- $\quad$ Strial punctures on declivity very minute to obsolete; female frons less deeply concave, vestiture slightly coarser, reddish yellow; Jalisco; 1.9-2.1 mm

7. velutinus Wood
8. Pityoborus comatus (Zimmermann) Figs. 208-211

Crypturgus comatus Zimmermann, 1868, Trans. Amer. Ent. Soc. 2:143 (Holotype, female: South Carolina; Mus. Comp. Zool., 996)
Pityoborus comatus: Blackman, 1922, Mississippi Agric. Expt. Sta. Tech. Bull. 11:96
Pityophthorus scriatus LeConte, 1878, Proc. Amer. Philos. Soc. 17:432 (Holotype, male; Tampa, Florida; Mus. Comp. Zool.); Blackman, 1928, New York St. Coll. For., Syracuse, Tech. Bull. 25:146. Synonymy
Diagnosis.- This species is distinguished from secundus Blackman by the smaller size, by the absence of reticulation on the elytra, by the more narrowly convex elytral declivity, with interstriae not impressed and granules on 1 and 2 very small or obsolete, and by the much smaller pubescent areas on the female pronotum.

Female.- Length $1.5-2.0 \mathrm{~mm}, 2.7$ times as long as wide; color yellowish to dark reddish brown.

Frons flat to upper level of eyes, slightly elevated toward epistoma; surface reticulate, sparsely, finely punctured in central area, lateral and upper margins more closely punctured; vestiture confined to margins, of rather abundant, fine, moderately long, yellow hair.

Pronotum 1.0 times as long as wide; widest at middle, sides weakly arcuate on more than posterior half, slightly constricted just behind broadly rounded anterior margin; anterior margin armed by about 14 rather coarse serrations; summit poorly developed, slightly anterior to middle; anterior slope rather coarsely, not closely asperate; posterior area rather strongly reticulate, punctures fine, shallow, rather sparse. Vestiture confined to a few setae on margins except anterolateral areas bearing rather large, oval areas of fine, dense, moderately long pubescence;
pubescent areas not extending behind middle of pronotum.

Elytra 1.6 times as long as wide, 1.6 times as long as pronotum; sides straight and parallel on basal two-thirds, rather narrowly rounded behind; striae not impressed, punctures fine, shallow, in rows; interstriae subshining, with numerous impressed points and a few obscure lines, punctures fine, shallow, sparse, irregularly placed. Declivity rather steep, convex; strial punctures much smaller than on disc, distinct, interstriae 1 feebly elevated, 2 impunctate, punctures on 1 and 3 fine, sometimes very feebly granulate. Vestiture of rows of minute strial hair and longer, erect, sparse setae on odd-numbered interstriae; usually abraded on disc.

Male. - Similar to female except frons weakly convex, punctures larger and more evenly distributed, subglabrous; pubescent areas on pronotum absent, anterior margin of pronotum more coarsely serrate.

Distribution. - Mississippi and North Carolina to Florida.

USA: Florida: Big Pine Key, Biscayne Bay, Dunedin, Everglades N.P., Lake Worth, Melbourne, Pensacola. Torreya St. Pk. in Liberty Co. Georgia: Kingsland. Louisiana: "Western Louisiana." Mississippi: Agricultural College, Gulf Port, Hattisburg, Laurel. North Carolina: Asheville, Cherokee. South Carolina: Florence, Poinsette St. Pk.

Hosts.-Pinus sp.
Biology. - As described for the genus.
Notes.- The above treatment was based on the holotype and on 46 other specimens.

## 2. Pityoborus secundus Blackman

Pityoborus secundus Blackman, 1928, Bull. New York St. Coll. For., Syracuse, Tech. Pub. 25:146 (Holotype, female; La Sal Mts., Utah; U.S. Nat. Mus.) Pityoborus tertius Blackman, 1942, U.S. Nat. Mus. 92:202 (Holotype, female; Chalco, D. F., Mexico;
U.S. Nat. Mus., 55980); Wood. 1973. Great Basin Nat. 33:182. Synonymy
Pityoborus intonsus Wood. 1958, Great Basin Nat. 18:54 (Holotype, female; 23 km or It miles W Texmelucan, Puebla, Mexico: Snow Ent. Mus.. Univ: Kansas); Wood, 1973, Great Basin Nat. 33:192. Synonymy
Pityoborus immitus Bright, 1972, Canadian Ent. 104:1674 (Holotype, female: 68 km W Durango. Durango, Mexico: Canadian Nat. Coll.); Wood, 1973, Great Basin Nat. 33:182. Synonymy
Pityoborus ramosus Bright, 1972. Canadian Ent. 104:1677 (Holotype, female; 5.6 km or 3.5 miles $S$ Suchixtepec, Oaxaca, Mexico: Canadian Nat. Coll.); Wood, 1973, Great Basin Nat. 33:182. Synonymy
Diagnosis.- This variable species is distinguished from comatus (Zimmermann) by the larger size, by the at least partly reticulate elytra, by the more broadly convex, (usually) impressed elytral declivity, and by the much larger pubescent areas on the female pronotum.

Female.- Length $1.8-2.7 \mathrm{~mm}, 2.8$ times as long as wide; color dark reddish brown.

Frons essentially as in comatus. Pronotum as in comatus except punctures on posterior areas slightly larger, closer; pubescent areas much larger, extending well behind middle of pronotum.

Elytra as in comatus except surface shallowly, often indistinctly reticulate; strial punctures slightly larger; declivity more broadly convex, interstriae 2 varying from feebly to moderately impressed, impunctate, 1 and 3 each with a row of distinct granules. Vestiture as in comatus.

Male.-Similar to female except feebly convex, punctures less conspicuous, less abundant, vestiture much less abundant but similarly arranged.

Distribution.- Utah and New Mexico to Puebla and Veracruz.

USA: Arizona: Lakeside, Oak Creek Canyon, Prescott. New Mexico: Cloudcroft. Utah: La Sal Mts. MEXICO: Durango: 5 km .17 km , and 37 km W El Salto. Hidalgo: 17 km N Jacala. Michoacán: Volcán Parícutin. Puebla: Texmelucan. Veracruz: Texcoco.

Hosts.- Pinus ayacahuite, P. leiophylla, P. ponderosa, P. pseudostrobus, P. spp.

Biology.-As described for the genus.
Notes.- The above treatment was based on holotypes of secundus, tertuis, and intonsus, on paratypes of immitus and ramosus, and on 161 other specimens. The specimens from Utah and New Mexico consistently have
declivital interstriae 2 rather strongly impressed and 1 and 3 more coarsely granulate, and the frons is frequently more irregularly and more coarsely sculptured. The series from Arizona and Mexico are inconsistent in both features; the declivity has little or no impression in most specimens, but occasional specimens are as strongly impressed as those from Utah and New Mexico. The size of the declivital granules in specimens from Arizona and Mexico varied from minute to moderately large, independent of geographical

Fig. 211. Dorsal aspect of Corthylini spp.: 51, Pityohorus comatus, female, 52, same, male; 53, Monarthrum fasciatum: 54, Monarthrum mali. (After Blackman 1923:pl. X.)
origin or depth of the impression. The shape and size of the pubescent areas on the female pronotum varied from series to series apparently without a pattern associated with geographical origin. Because of this variation, the forms represented by tertuis, intonsus, immitus, and ramosus, were placed in synonymy.

## 3. Pityoborus hirtellus Wood

Pityoborus hirtellus Wood, 1958, Great Basin Nat. 18:50 (Holotype, female; 14 miles or 23 km NW Guadalajara, Jalisco, Mexico; Snow Ent. Mus., Univ. Kansas)
Diagnosis.- This species is distinguished from rubentis Wood by the more slender body form, by the reticulate elytral surface, with elytra! punctures slightly larger, by the less strongly concave frons with shorter, yellow, less abundant vestiture, and by the absence of a median elevation on the male frons.

Female.- Length 2.9-3.2 mm, 2.7 times as long as wide; color dark brown, often with a yellowish caste.

Frons broadly, moderately, evenly concave from epistoma to above eyes; surface subreticulate, punctures fine, shallow, sparse near central area, more numerous toward margins; vestiture in central area fine, sparse, short, on margins dense, very long, longest setae on vertex, their tips almost attaining epistoma.

Pronotum 0.96 times as long as wide; essentially as in secundus Blackman.

Elytra 1.7 times as long as wide, 1.9 times as long as pronotum; outline as in secundus; striae not impressed, punctures in irregular rows except confused on basal third of disc; interstriae obscurely subreticulate in most specimens, punctures in rows, similar to those of striae, small, shallow, not sharply defined. Declivity rather steep, rather broadly convex; strial punctures in rows, minute, almost obsolete; interstriae 1 and 3 feebly elevated, 2 weakly impressed, 1 and 3 each armed by a row of fine granules. Vestiture of rows of fine, minute strial hair, and rows of fine, very long interstrial hair on all except declivital interstriae 2, those on disc one to two times as long as distance between rows, three to five times as long on declivity.

Male. - Similar to female except frons weakly convex, more strongly reticulate, vestiture more uniformly distributed, shorter, less abundant, a few of those on margins longer; pubescent areas on pronotum absent.

Distribution.- Durango to Jalisco.
MEXICO: Durango: 17 km , No. 39 a , and 29 km , No. 391, W El Salto, 7-V1-65, 2500 m , Pinus pseudostrolus, S. L. W'ood. Jalisco: Guadalajara, 19-VI-53. Pinus, S. L. Wood.

Hosts.- Pinus pseudostrobus, P. sp.
Biology.-As described for the genus.
Notes.- The above treatment was based on the female paratype and on 84 other specimens.

## 4. Pityoborus rubentis Wood

Pityoborus rubentis Wood. 1958, Great Basin Nat. 18:51 (Holotype, female; 14 miles or 23 km W Texmelucan, Puebla, Mexico; Snow Ent. Mus., Univ. Kansas)
Diagnosis.- This species is distinguished from hirtellus Wood by the slightly stouter body form, by the smoother elytra, with numerous impressed points, by the more strongly concave frons with longer, more abundant, reddish vestiture, and by the presence of a small median elevation on the male frons.

Female. - Length $2.8-3.2 \mathrm{~mm}, 2.5$ times as long as wide; color dark reddish brown.

Frons as in hirtellus except more strongly impressed, vestiture on margins reddish yellow, slightly longer and more abundant. Pronotum as in hirtellus except anterior margin less coarsely, less regularly serrate, punctures on posterior area usually smaller. Elytra 1.6 times as long as wide; as in hirtellus except discal surface smooth, with numerous minute impressed points, strial punctures usually more confused; vestiture usually less abundant and slightly shorter.

Male.- Similar to female except frons weakly concave, more strongly reticulate, with a weak median carina on lower half; pubescent areas on pronotum absent.

Distribution.- Chihuahua and Michoacán to Veracruz and Puebla.

MEXICO: Chihuahua: La Magdalena, 26-IV-77, Hopk. 60607-A, M. M. Furniss. Durango: 5 km W El Salto, $7-\mathrm{Vl}-65$, No. 40, Pinus, S. L. Wood; 37 km W Durango, 4-V1-65, No. 14, Pinus, S. L. Wood. Michoacán: 10 km E Volcán Parícutin, 19-Vl-65, 2500 m , No. 89, Pinus, S. L. Wood. Puebla: 23 km W Texmelucan, 14 -V11-53, 2800 m , Pinus, S. L. Wood. Veracruz: Texcoco, km 20, 5-II-62, Pinus, R. Coronado.

Host. - Pinus spp.
Biology.- As described for the genus.
Notes. - The above treatment was based on a female paratype and on 38 other specimens.

## 5. Pityoborus hondurensis Wood

Pityoborus hondurensis Wood, 1971, Brigham Young Univ. Sci. Bull., Biol. Ser. 15(3):49 (Holotype, female; Yuscarán, Paraiso, Honduras; Wood Coll.)
Diagnosis.- This species is distinguished from velutinus Wood by the weakly impressed declivital interstriae 2 , with fine granules on 1 and 3, and by the weakly convex male frons, with the vestiture rather sparse, shorter, and uniformly distributed.

Female.- Length $1.8-2.1^{1} \mathrm{~mm}, 2.6$ times as long as wide; color réddish brown.

Frons as in velutinus except very slightly less strongly impressed on a narrower area, with fine, sparse punctures; lateral vestiture finer, less abundant, much shorter. Pronotum as in velutinus except pilose areas distinctly smaller; posterior area with moderately abundant, small, shallow punctures clearly evident.

Elytra as in velutinus except punctures on disc deeper, slightly larger, with a few more interstrial punctures particularly on posterior half; declivital punctures smaller than on dise but much larger and deeper than in velutinus, interstriae 1 distinctly elevated, strial and interstrial punctures in somewhat indistinct rows; sparse vestiture on declivity more abundant than in velutinus.

Male.- Similar to female except frons not at all concave, vestiture greatly reduced; pilose areas on pronotum absent; pronotal punctures less distinct; punctures on discal striae slightly larger; declivital interstriae 1 and 3 with minute granules.

Distribution.- Honduras and British Honduras.
HONDURAS: Yuscarán. Paraiso, 23-1V-64. $8(0) \mathrm{m}$. No. 518, Pimus caribaca, No. 519, P. oocarpa, S. L. Wood. british honduras: Río Privassion, Cayo Distr. Belise, 9-VII-73, Y. S. Sedman.

Hosts.- Pinus caribaea, P. oocarpa.
Biology.- As described for the genus.
Notes.- The above treatment was based on the type series of 13 specimens and on 2 other specimens.

## 6. Pityoborus frontalis Wood

Pityoborus frontalis Wood, 1971, Brigham Young Univ. Sci. Bull., Biol. Ser. 15(3):49 (Holotype, female; 13 km S El Cameron, Oaxaca, Mexico; Wood Coll.)
Pityoborus severus Bright, 1972. Canadian Ent. 104:1676 (Holotype, female, 5 km or 3 miles N Suchixtepec, Oaxaca, Mexico; Canadian Nat. Coll.); Wood. 1973. Great Basin Nat. 33:182. Synonymy
Diagnosis.- This species is distinguished from celutinus Wood by the more deeply concave female frons, with the frontal vestiture finer and pale yellow in color, and by the much larger, deeper strial punctures on the declivity.

Female.- Length 2.0-2.6 times as long as wide; color rather dark reddish brown.

Frons as in velutinus except much more deeply concave on a narrower circular area; vestiture in lateral areas much finer, pale yellow in color. Pronotum as in velutinus except reticulation stronger, punctures more clearly evident.

Elytra as in celutinus except reticulation stronger, declivity more nearly shining; strial punctures on declivity larger, deeply impressed.

Male.-As in female except frons not concave, feebly impressed, surface reticulate, vestiture on lateral and upper margins similar but slightly less abundant; pilose areas on pronotum absent.

Distribution.- Oaxaca.
MEXICO: Oaxaca: 13 km SE El Cameron, 21-V1-67. No. 75, Pinus, S. L. Wood.

Biology - As described for the genus.
Notes.- The above treatment was based on the holotype and allotype.

## 7. Pityoborus velutinus Wood

Pityoborus velutinus Wood, 1958, Great Basin Nat. 18:48 (Ilolotype, female; 14 miles or 23 km NW Guadalajara, Jalisco, Mexico; Snow Ent. Mus., Univ. Kansas)
Diagnosis.- This species is distinguished from hondurensis Wood and frontalis Wood by characters indicated in the above key and in the diagnosis of the two allied species.

Female.- Length $1.9-2.1 \mathrm{~mm}, 2.6$ times as long as wide; color yellowish to rather dark reddish brown.

Frons rather strongly concave on median three-fourths from epistoma to distinctly
above eyes; surface subshining, minutely irregular, devoid of punctures in concave area; margins ornamented by a moderately dense row of long yellow hair.

Pronotum 0.98 times as long as wide; essentially as in hirtellus Wood except punctures on posterior areas usually obsolete.

Elytra 1.6 times as long as wide, 1.7 times as long as pronotum; outline as in hirtellus; strial punctures small, in rows posteriorly, rather irregular on basal third; interstriae reticulate, punctures small, rather widely, regularly spaced. Declivity steep, narrowly convex; strial punctures minute, almost obsolete, in rows; interstriae 1 to 3 similarly sculptured, interstrial punctures minute (including 2). Minute strial hair usually absent; vestiture of rows of erect interstrial setae on all interstriae, including 2 on declivity, each seta about as long as distance between rows, similarly or more widely spaced within a row.

Male.- Similar to female except frons feebly concave at least on upper half, strongly reticulate, sparsely, shallowly punctured, vestiture similar but much less abundant, shorter; pubescent areas on pronotum absent.

Distribution.- Jalisco.
MEXICO: Jalisco: 23 km NW Guadalajara, 19-viI-53. Pinus, S. L. Wood.

Biology.- As described for the genus.
Notes.- The above treatment was based on 25 paratypes.

## Genus DACNOPHTHORUS Wood

Dacnophthorus Wood, 1975, Great Basin Nat. 35:394 (Type-species: Gnathophthorus clematis Wood, original designation)
Diagnosis.- This genus is distinguished from Pityophthorus Eichhoff by the very slender body form, by the very large, coarsely faceted eyes, by the large antennal club which has three distinct sutures, the third marked only by setae, by the summit being
anterior to the middle of the pronotum and without a transverse impression behind it, by the slightly different elytral declivity, and by the very different habits.

Description.- Length $1.1-2.0 \mathrm{~mm}$, 3.7-3.8 times as long as wide; color pale yellow to bicolored with yellow and dark brown, almost black in a Colombian species.

Frons dimorphic, male convex above, impressed below, female uniformly shallowly concave to lower third, then weakly convex and upper area variously sculptured and ornamented by hair; eye very large, coarsely faceted, emarginate. Antennal scape slender, elongate; funicle 5 -segmented, some specimens apparently 4 -segmented; club large, much longer than scape, sutures 1 and 2 partly septate, 3 clearly indicated by setae and rather remote from apex. Pronotum elongate, summit anterior to middle, without a transverse impression behind summit. Scutellum rather large, flat. Elytra striate; declivity rather short, steep. Legs as in Pityophthorus.

Distribution.- Colima to Brazil; six species are known; two occur in Mexico and Central America.

Biology. - Four of the known species infest cut or broken vines of Clematis and an undetermined Bignoniaceae. The monogamous beetles construct transverse biramous egg galleries in the cambium region in Clematis. In Bignoniaceae the vine structure was made up of numerous concentric layers and a pair of beetles bored from the outer surface to a depth of six or more layers and constructed a transverse, biramous pair of egg tumnels at each layer. Larval mines are straight, rather short, parallel to one another, and follow the grain of the wood or fiber. Ambrosial fungi were not observed, although the discoloration of parental galleries suggested they might be present. The entire gallery system suggested a stage intermediate between a phloeophagous and a mycetophagous habit.

## Key to the Species of Dacnophthorus

1. Larger; pronotal and strial punctures moderately large, rather deep; declivital interstriae 2 rather strongly impressed, 1 and 3 distinctly elevated, granules on 3 minute or absent; pile on upper area of female frons very short, not obscuring surface; Jalisco to Panama; Clematis; 1.4-2.0 mm
2. clematis (Wood)

- Smaller; pronotal and strial punctures minute, shallow; declivital interstriae 1 not elevated or granulate, 3 moderately elevated and armed by a row of conspicuous granules; pile on upper area of female frons dense, moderately long; Honduras; 1.2 mm

2. cracens (Wood)

## 1. Dacnophthorus clematis (Wood)

Fig. 212

Gnathophthorus clematis Wood, 1971, Brigham Young Univ. Sci. Bull., Biol. Ser. 15(3):51 (Holotype, female; Volcán Colima, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished by the slender body form, by the very different female frons, by the steep, strongly impressed elytral declivity, and by other characters.

Female.- Length $1.4-2.0 \mathrm{~mm}, 3.8$ times as long as wide; color light yellowish brown, pronotum and elytral declivity slightly darker.

Frons flattened from just above epistoma to vertex, transversely divided at upper level of eyes by a feeble summit; lower area coarsely, shallowly, closely punctured, with sparse, uniformly distributed, inconspicuous, hairlike pubescence; upper area appearing somewhat spongy, very minutely, densely punctured, with microscopic pilelike pubescence and with a marginal fringe of short hair of uniform length, little if any longer than setae on lower frons. Eye large, emarginate, coarsely faceted. Antennal funicle 5segmented, last four segments crowded, indistinct, club very large, with three moderately procurved, nonseptate sutures.

Pronotum 1.4 times as long as wide; sides on basal half straight and parallel, constricted slightly in front of middle then weakly arcuate to broadly rounded anterior margin; anterior margin armed by eight widely spaced, coarse teeth; summit on anterior third, indefinite; anterior third rather finely asperate; posterior area smooth, with fine, deep, sparse punctures. Glabrous except for scattered hair near lateral margins.

Elytra 2.4 times as long as wide, 1.8 times as long as pronotum; sides straight and parallel on more than basal three-fourths, broadly rounded behind; declivity confined to posterior one-sixth; striae not impressed, punctures minute, scarcely indicated on surface; interstriae almost smooth, impunctate. Declivity steep, rather strongly excavated; striae obsolete; interstriae 1 moderately elevated, with a
row of moderately coarse punctures; area of interstriae 2 strongly impressed, widened at middle; lateral areas strongly elevated on upper two-thirds, summit broadly rounded, with rather coarse, confused punctures, two very feeble granules on upper margin of elevated area. Disc glabrous; moderately abundant, coarse hair on declivity.

Male. - Similar to female except frons convex above, lower half abruptly impressed, subreticulate, punctures rather coarse, vestiture sparse, inconspicuous; granules on elytral declivity larger, pointed.

Distribution.- Jalisco to Panama.
MESICO: Jalisco: Volcán Colima, 23-V1-65, 2500 m , No. 100, Clematis. S. L. Wood. HONDURAS: La Ceiba, Atlántida, 20-V-49, at light, E. C. Becker. COSTA RICA: Tapantí, Cartago, 17-1X-63. 1300 m , No. 183 , Clematis, S. L. Wood; Volcán Irazu, Cartago, 26-IX-63, 2300 m , No. 238, Clematis, S. L. Cood. PANAMA: Cerro Punta, Chiriquí, 11-1-64, 1700 m , No. 409. Clematis, S. L. Wood.

Hosts.-Clematis sp.
Biology.- These monogamous beetles infest cut or injured vines larger than 2 cm in diameter. The biramous transverse egg galleries are formed in the cambium region. The

Fig. 212. Dacnophthorus clematus, female outline from dorsal aspect and head. (After Wood 1971:52.)
short, longitudinal larval mines are formed between the coarse fibers of the host.

Notes.- The above treatment was based on the type series of 106 specimens and on 92 other specimens.

## 2. Dacnophthorus cracens (Wood)

Gnathophthorus cracens Wood, 1971, Brigham Young Univ. Sci. Bull., Biol. Ser. 15(3):53 (Holotype, female; La Ceiba, Atlantida, Honduras; Wood Coll.)
Diagnosis.- This species is distinguished from clematis (Wood) by the smaller size, by the serrate elytral declivity, and by the different female frons.

Female.- Length 1.2 mm , about 3.8 times as long as wide; color yellowish brown.

Frons as in clematis except lower area flat, very finely, sparsely punctured, ending well
below upper level of eyes; upper area slightly more extensive, pile long, dense, setae on marginal fringe on upper margin only, much longer, tips reaching middle of pilose area. Pronotum as in clematis except anterior margin armed by 10 teeth; punctures on posterior area minute.

Elytra as in clematis except declivity narrowly, deeply sulcate; sutural interstriae feebly elevated; lateral areas abruptly elevated from position of striae 2 , summit armed by five or six small, laterally compressed teeth.

Distribution.- Honduras.
HONDURAS: La Ceiba, Atlantida, 15-V-49, at light, E. C. Becker.

Notes.- The above treatment was based on the unique holotype.

Gnathotrichus Eichhoff, 1869, Berliner Ent. Zeitschr. 12:275 (Type-species: Gnathotrichus corthyloides Eichhoff, $1869=$ Tomicus materiarius Fitch, 1858, monobasic)<br>Gnathotrichoides Blackman, 1931, J. Washington Acad. Sci. 21:267 (Type-species: Cryphalus sulcatus LeConte, present designation). New synonymy<br>Ancyloderes Blackman, 1938, Proc. Ent. Soc. Washington 40:205 (Type-species: Cryphalus pilosus LeConte, original designation); Wood, 1973, Great Basin Nat. 33:172. Synonymy<br>Paraxyleborus Hoffmann, 1942. Bull. Soc. Ent. France $47: 72$ (Type-species: Xyleborus duprezi Hoffmann =Tomicus materiarius Fitch, monobasic); Balachowsky, 1949, Faune de France 50:241. Synonymy<br>Prognathotrichus Bright, 1972, Canadian Ent. 104:1678 (Type-species: Prognathatrichus primus Bright, original designation); Wood, 1973, Great Basin Nat. 33:172. Synonymy

Diagnosis.- This genus is distinguished from the closely allied Gnathotrupes Schedl by the less strongly arcuate, less deeply marked, and more sparsely pubescent sutures of the antennal club (the larger segment 1 may also be a character), by the more gradual, convex elytral declivity, with the posterior margin more broadly, often narrowly rounded and the costal margin more strongly elevated near the apex, and by the distribution.

Description.- Length $2.0-3.7 \mathrm{~mm}$, 2.9-3.3 times as long as wide; color light brown to almost black. Vestiture hairlike.

Frons weakly to strongly convex, conservatively sculptured, sexually dimorphic or not; eye oval, emarginate; finely granulate. Antennal scape elongate; funicle 5 -segmented; club moderately large, rather sparsely pubescent, a few very long setae (a female character), sutures modestly impressed, septate, almost straight to moderately arcuate. Pronotum elongate, summit anterior to middle, poorly defined; anterior slope rather finely asperate, anterior margin elevated and serrate; posterior areas finely sculptured. Scutellum rather large, flat. Elytra elongate, striate or not; declivity moderately steep, convex, often sulcate or bisulcate, rather conservatively scuptured; sutural apex normally entire, costal margin near apex moderately to very strongly, acutely elevated. Anterior tibiae with two or more socketed teeth at or near apex of lateral margin, lateral margin also usually armed by a row of serrations to near base.

Distribution.- North and Central America; 13 species are recognized.

Hosts. - Pinaceae, Quercus, and rarely in other hosts.

Biology.- Dying, standing trees or recently cut or fallen logs are selected for attack by these monogamous beetles. The male constructs a radial entrance tunnel that extends through the bark and into the wood. The male inoculates the tunnel wall with fungal spores carried in the coxal cavities (Farris 1963) and is joined by a female. One or more transverse egg tunnels branch on the same plane as the entrance tunnel, following growth rings in the wood. The egg tunnels may follow a growth ring in one or both directions from the entrance tunnel at one or several levels of growth rings. Eggs are deposited individually in large egg niches formed by the female parent. The larva enlarges the niche to accommodate its growth until it is just large enough for the adult state. Pupation occurs in the larval cradles and the young adults emerge through the parental tunnels. The larval food evidently consists of the ambrosial fungus, although some xylem may also be utilized.

The above notes were based on field observations of all included species except pilosus (LeConte). Confirmation, in part, is found in Doane and Gilliland (1929), and Prebble and Graham (1957).

Notes.- Several South American species of Gnathotrichus have been named. Of the 13 described and undescribed South American species in this generic complex before me, all
are more appropriately placed in Gnatho- Gnathotrichus (s. str.) does not occur in South trupes Schedl. It is assumed, therefore, that America.

## Key to the Species of Gnathotrichus

1. Punctures of striae and interstriae on elytral disc rather abundant, close, strongly confused, impressed points also evident; elytral vestiture of fine, abundant hair to base; host Quercus2

- Strial punctures on dise in rows, interstriae impunctate except for impressed points (except deleoni striae obsolete, confused impressed points rather large); elytral dise glabrous or nearly so; in coniferous hosts except for two tropical species6

2(1). Elytral dise minutely, regularly reticulate, punctures minute, obscure, almost obsolete; declivity of female feebly impressed, all interstriae with minute granules; frons very broad, broadly convex, finely aciculate on at least lower half, punctured above, female with a broad, strong, blunt, median carina on upper area3

- Elytral surface rather smooth, with a few impressed lines; female frons never with a median carina; elytral declivity variously sculptured
3(2). Frons aciculate on lower half, female median carina commencing well below upper level of eyes and extending toward vertex; declivity steeper, less broadly convex; female elytral vestiture less abundant, shorter; Tlaxcala to Puebla; Quercus; 2.5 mm

1. obscurus Wood

- Frons aciculate to upper level of eyes, female median carina above upper level of eyes; female elytral vestiture more abundant, much longer; Chiapas; 3.0-3.3 mm

2. primus (Bright)

4(2). Larger; elytral declivity subsulcate on upper half, lateral margin in female armed by a pair of very coarse spines (often with two or more points), male with one or two much smaller denticles; female frons with a small, transverse carina at or slightly above upper level of eyes; male frons and lower half of female frons finely aciculate; Durango and Michoacán; Quercus; 3.1-3.6 mm
3. dentatus Wood

- Smaller; elytral declivity convex, with a very feeble impression in both sexes or with female deeply, narrowly sulcate, several small granules on interstriae 3; elytral apex less strongly produced; pronotal punctures coarser .5
$5(4)$. Costal margin at apex of elytra moderately produced; female elytral declivity strongly sulcate, male declivity feebly impressed; anterolateral angles of male pronotum bearing a small tuft of hair; female frons strongly convex, aciculate only on lower third; Arizona to Puebla; Quercus; $2.5-3.0 \mathrm{~mm}$
- Costal margin at apex of elytra rather weakly produced; elytral declivity feebly impressed in both sexes; male pronotum without a special tuft of hair; frons aciculate in both sexes; California and Arizona to Durango; $2.0-2.3 \mathrm{~mm}$..

5. pilosus (LeConte)

6(1). Pregula protuberant, projecting slightly anteroventrad; sutures of antennal club usually less strongly arcuate; frons usually less strongly aciculate to smooth (except strongly aciculate in perniciosus)

- Pregula not projecting beyond margin of oral cavity; sutures of antennal club usually more strongly arcuate; frons usually more strongly, convergently aciculate

7. nitidifrons Hopkins

- Elytral declivity more broadly, evenly convex, surface shining; strial punctures usially obsolete, occasionally in interrupted or complete rows; female frons evenly convex or feebly, transversely impressed, rarely impunctate at median line; male weakly aciculate; Durango to Mexico and Tlaxcala; Pinus; 2.8-3.3 mm

8. deleoni Blackman
10(7). Smaller; frons rather strongly aciculate; elytral declivity with sulcus rather
shallow, narrow, granules on lateral convexities very small; Sinaloa and
Chihuahua to Honduras; Pinus; $2.2-2.6 \mathrm{~mm}$.............................. 9. perniciosus Wood

- Larger; frons feebly if at all aciculate; declivital sulcus deeper, wider, granules on lateral convexities larger
11(10). Frons weakly aciculate in median area of lower half; declivital sulcus deeper, lateral convexities more abruptly elevated; British Columbia and NW Utah to Baja California; various conifers; 3.3-3.7 mm

10. retusus (LeConte)

- Frons smooth, no indication of aciculation; declivital sulcus not quite as deep, latera! convexities rise less abruptly; E Utah and South Dakota to Michoacán, Puebla; Pinus; 2.8-3.3 mm ................................................. 11. denticulatus Blackman
12(6). Pronotal disc smooth, punctures moderately coarse; frons shallowly, arcuately, transversely impressed at upper level of eyes; elytral declivity steeper, more broadly rounded behind, costal margin at apex poorly developed; Arizona and New Mexico to Durango and Hidalgo; Pinus; 2.8-3.1 mm
- Pronotal disc rather strongly reticulate, punctures fine; frons without a transverse impression; elytral declivity not as steep, more narrowly rounded behind, costal margin at apex more conspicuously elevated 13

13(12). Strial punctures on declivity very small, in rows; declivity moderately to rather
shallowly but distinctly sulcate; British Columbia and South Dakota to
Honduras; coniferous hosts; $2.8-3.5 \mathrm{~mm}$
13. sulcatus (LeConte)

- Strial punctures almost obsolete and confused on declivity; elytral declivity feebly if at all impressed
14(13). Elytral declivity with interstriae 3 unarmed or with very minute, rounded granules; Guatemala to Costa Rica; nonconiferous hosts; 3.3-3.6 mm

14. omissus Wood

- Elytral declivity armed at base on interstriae 3 by two closely set pairs of sharply pointed small denticles; Chiapas to Guatemala; $4.1-4.3 \mathrm{~mm}$

## 1. Gnathotrichus obscurus Wood

Gmuthotrichus obscurus Wood, 1974. Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):55 (Holotype, female; 6 miles or 9 km NE Teziutlan, Puebla, Mexico; Wood Coll.)
Diagnosis.- This and primus (Bright) are the only species in the genus having confused punctures on the elytral disc that have the elytral surface minutely reticulate and rows of minute granules on all declivital interstriae. It is distinguished from primus as indicated in the above key.

Female.- Length $2.5 \mathrm{~mm}, 3.0$ times as long as wide; color reddish brown.

Frons broad, broadly convex, surface shining, finely, convergently aciculate on lower two-thirds, rather finely, sparsely punctured above, a strongly developed rather low median carina from middle to upper level of eyes (concealed by pronotum above eyes on type). Vestiture of fine, rather sparse hair.

Pronotum 1.24 times as long as wide; as in dentatus Wood except posterior areas reticulate, finely, closely, rather deeply punctured.

Elytra 1.7 times as long as wide; sides straight and parallel on basal two-thirds, narrowly rounded behind; striae obsolete; surface minutely reticulate, punctures minute, obscure, confused, a few granules on interstriae 3 near declivity. Declivity steep, broadly convex; very feebly sulcate on upper half, strial punctures not evident, interstriae marked by rows of very small granules, slightly larger on 3; costal margin at apex rather strongly elevated. Vestiture of fine hair, on disc of short, moderately abundant hair and interstrial rows of long, fine hair; all hair on declivity long, moderately abundant, length of longest setae about equal to onefifth width of body.

Distribution.- Tlaxcala to Puebla.
NEXICO: Puebla: 9 km NE Teziutlan, 2-VIl-67, 1600 m. No. 152, Quercus, S. L. Wood. Tlaxcala: Villareal, 4-VII-78, pheromone trap, M. M. Furmiss.

Host.-Quercus sp.
Biology.- The holotype was taken from a $\log 15 \mathrm{~cm}$ in diameter.

Notes. - The above treatment was based on the holotype and on one other female.

## 2. Gnathotrichus primus (Bright)

Prognathotrichus primus Bright, 1972, Canadian Ent. 104:1678 (Holotype, male; Mt. Tzontehuitz, Chiapas, Mexico; Canadian Nat. Coll.)
Diagnosis.- This species is distinguished from obscurus Wood by the more extensively aciculate female frons, with the punctures almost obsolete, and the median carina visible only above the upper level of the eyes, by the more finely, less distinctly punctured pronotal disc, and by the more abundant, much longer elytral vestiture.

Female.- Length $3.0-3.3 \mathrm{~mm}, 2.9$ times as long as wide; color rather dark yellowish brown.

Frons as in obscurus except aciculation extending to upper level of eyes, carina commencing at upper level of eyes and extending toward vertex, vestiture longer, slightly more abundant.

Pronotum as in obscurus except more finely, less deeply punctured.

Elytra as in obscurus except declivity not as steep, more broadly rounded; vestiture more abundant and considerably longer, longest setae on declivity equal in length to one-third width of body (about one-fifth width of body in obscurus).

Male.-Similar to female except aciculation on frons more strongly developed, carina absent; elytral vestiture shorter, less abundant (as in female obscurus).

Distribution. - Chiapas.
MEXICO: Chiapas: Mt. Tzontehuitz, 26-V-69, 3100 m, D. E. Bright.

Notes.- The above treatment was based on the holotype and on two paratypes.

## 3. Gnathotrichus dentatus Wood Fig. 216

Gnathotrichus dentatus Wood, 1967, Great Basin Nat. 27:45 (Holotype, female; 18 miles or 29 km W El Salto, Durango, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from nimifrons Wood by the larger size, by the small transverse frontal carina in the female, and by the impressed and armed female declivity.

Female.- Length 3.1-3.6 mm, 3.1 times as long as wide; color dark brown.

Frons very broad, convex; surface rather coarsely, shallowly punctured, becoming increasingly aciculate on lower half toward
median portion of epistoma; a short, transverse, elevated carina in median area at upper level of eyes and from it an impunctate line extending dorsad; vestiture short, inconspicuous.

Pronotum 1.2 times as long as wide; sides straight and parallel on basal half, rather broadly rounded in front; anterior margin armed by 10 low serrations; summit indefinite, in front of middle; posterior area smooth, subshining, finely, shallowly, rather sparsely punctured; vestiture fine, short, rather abundant on sides.
Elytra 2.0 times as long as wide; sides almost straight and parallel on basal threefourths, narrowly rounded behind and narrowly notched at suture; punctures obsolete, striae and interstriae not indicated: surface very finely marked by surface lines and indefinite, shallow punctures, dull. Declivity with a broad, moderately deep sulcus between pair of prominent processes borne on interstriae 3; lateral processes supported on prominent lateral elevations, processes arising from median edge of elevation and bearing on their dorsal margins a series of (two or) three rather large teeth; teeth directed caudad and somewhat mesad, increasing slightly in size posteriorly; about three small dentations on interstriae 3 anterior to process, and with three similar small tubercles on interstriae 1 at base of declivity; elytral apex explanate and narrowly notched. Vestiture consisting of rather abundant minute hairs and some longer, erect, coarse, hairlike setae.

Male.- Similar to female except frons less strongly convex and devoid of carina; anterolateral angles of pronotum with a small tuft of hair; and elytral declivity with suleus shallow, lateral processes not strongly developed, and dentations absent except for one or two small, rounded granules.
Distribution.- Durango to Michoacán.
MEXICO: Durango: $5 \mathrm{~km}, 16 \mathrm{~km}$, and $29 \mathrm{~km} W$ El Salto, 7-VII-65, Quercus, S. L. Wood. Michoacán: 53 km E Morelia, I4-VII-65, Quercus, S. L. Wood.

Hosts.- Quercus spp.
Biology.- As described for the genus. Stems larger than 20 cm in diameter are at-
tacked. The tunnels appeared to be similar to those of other representatives of the genus.

Notes. - The above treatment was based on the type series of 61 specimens. The sexes were reversed in the original description.

## 4. Gnathotrichus nimifrons Wood

Gnathotrichus nimifrons Wood, 1967, Great Basin Nat. 27:47 (Holotype, female; 18 miles or 29 km W El Salto. Durango, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from dentatus Wood by the smaller size, by the absence of a female frontal carina, and by the very different elytral declivity.

Female.- Length 2.5-3.0 mm, 3.3 times as long as wide; color brown.

Frons very broad, strongly convex; surface smooth and shining in central area, shallowly punctured laterally, weakly aciculate toward epistoma; vestiture sparse, inconspicuous.

Pronotum 1.3 times as long as wide; as dentatus except posterior areas more finely, shallowly, closely punctured.

Elytra 1.9 times as long as wide; sides straight and subparallel on basal threefourths, rather narrowly rounded behind, shallowly notched at suture; striae and interstriae not indicated; surface minutely irregular, with rather sparse, shallow, fine punctures. Declivity rather narrowly, deeply sulcate, moderately steep; suture not raised, lateral area including interstriae 3 strongly elevated from declivital base about twothirds distance to apex, crest armed by about seven small, pointed granules; elytral apex explanate, narrowly notched. Vestiture consisting of fine, short, hairlike setae on disc and sides, becoming much longer and abundant on declivity.

Male.-Similar to female except frons less strongly convex and with fine aciculate lines extending at least to upper level of eyes; declivity shallowly sulcate, lateral elevations poorly developed, granules fewer in number and smaller.

Distribution.- Arizona and Puebla.
USA: Arizona: Carr Canyon, 8-VIII-62, at light, S. L. Wood. MEXICO: Durango: 29 km W El Salto, 7 -VI-65, 2500 m , No. 37, Quercus, S. L. Wood. Puebla: 9 km NE Teziutlan, 2-VII-67, 1600 m , No. 152, Quercus, S. L. Wood.

Hosts.- Quercus spp.

Biology.- As described for the genus. Specimens were taken from material 15-60 cm in diameter.

Notes.- The above treatment was based on the type series of four specimens, and on two other specimens.

## 5. Gnathotrichus pilosus (LeConte)

Cryphalus pilosus LeConte, 1868, Trans. Amer. Ent. Soc. 2:156 (Lectotype, sex?; middle California; Mus. Comp. Zool., 1006, present designation); Blackman, 1938, Proc. Ent. Soc. Washington 40:204 (pilosus not pilosulus, corrected spelling)
Cnathotrichus pilosus: Wood, 1973, Great Basin Nat. 33:172
Ancyloderes saltoni Blackman, 1938, Proc. Ent. Soc. Washington 40:206 (Holotype, sex?; Flagstaff, Arizona; U.S. Nat. Mus., 52849); Wood, 1966, Great Basin Nat. 26:21. Synonymy
Diagnosis.- This species is distinguished from nimifrons Wood by the smaller size, by the more narrowly convex, finely aciculate frons in both sexes, and by the feebly impressed elytral declivity in both sexes.

Female.- Length $2.0-2.3 \mathrm{~mm}, 3.0$ times as long as wide; color yellowish to reddish brown.

Frons rather broadly convex, moderately shining, convergently aciculate from above eyes to epistomal margin, a few small punctures interspersed on upper half; vestiture fine, rather sparse, inconspicuous. Antennal club oval, sutures 1 and 2 partly septate, almost straight.

Pronotum 1.3 times as long as wide; sides almost straight and parallel on basal half, moderately rounded in front; anterior margin armed by about 12 low serrations; summit rather indefinite, anterior to middle; anterior slope rather finely asperate; posterior areas minutely reticulate, punctures rather coarse, moderately deep, rather close. Vestiture of fine, short, moderately abundant hair, usually abraded.

Elytra 1.8 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal two-thirds, slightly tapered, then somewhat broadly rounded behind; surface shining, with a few impressed, irregular
lines, some impressed points, punctures small, rather shallow, confused. Declivity rather steep, broadly convex; sculpture about as on disc except feebly impressed between interstriae 3 , interstriae 1 to 3 with rows of very minute granules; costal margin at apex distinctly but rather weakly elevated. Vestiture of moderately abundant fine hair, short on disc and sides, moderately long on declivity.

Male-S Similar to female except elytral declivity more strongly but rather weakly impressed, granules on interstriae 3 distinctly larger.

Distribution.- California and Arizona to Durango.

USA: Arizona: Baboquivari, Flagstaff, Florence Junction. Oak Creek Canyon. Patagonia. California: Faumskin, Mtt. Laguna, North Fork, Ojai, Pasadena, Pomona, Santa Barbara, Yosemite. Nevada: Beaver Dam St. Pk. New Mexico: Pinos Altos in Grant Co. MENICO: Durango: El Salto.

Host.- Unknown, probably Quercus.
Biology.- All known specimens were taken in flight; some were attracted to light. All allied species breed in oak.

Notes.- The two syntypes of pilosus, the holotype of saltoni Blackman, and 32 other specimens were examined. The principal differences in this material appear to be secondary sexual characters. The first syntype in the LeConte collection is here designated as the lectotype. It was labeled "Type" many years ago, but was never officially so designated.

## 6. Gnathotrichus materiarius (Fitch)

Figs. 201, 207
Tomicus materiarius Fitch, 1858, Trans. New York State Agric. Soc. 17:726 (Holotype, female; New York: U.S. Nat. Mus., 42806)

Gnathotrichus matcriarius: Eichhoff, 1878, preprint of Mém. Soc. Roy. Sci. Liége (2)8:406.
Gnathotrichus corthyloides Eichhoff, 1869, Berliner Ent. Zeitschr. 12:275 (Syntypes ?: Carolina; presumably lost with Hamburg Mus.); Eichhoff, 1878, Mém. Soc. Roy. Sci. Liége (2)8:406. Synonymy
Nylchorus duprezi Hoffmann, 1936, Misc. Ent. 37:43 (Holotype, female; Forêt du Rouvay, SeineInferieure, France; repository?); Balachowsky, 1949, Fauna de France 50:242. Synonymy
Diagnosis.- This species is distinguished by the protruding pregula, by the feebly sulcate elytral declivity, with the surface shagreened, by the absence of frontal aciculation, and by the fine, distinct strial punctures.

Female.- Length $1.7-3.1 \mathrm{~mm}, 3.1$ times as long as wide; color dark brown.

Frons irregularly convex, a weak, transverse impression on upper half, epistomal area indistinctly elevated toward median line; surface smooth, subshining, punctures moderately coarse, shallow, irregularly distributed; vestiture sparse, inconspicuous. Antenna with a dozen or more long, hairlike setae.

Pronotum 1.3 times as long as wide; as in pilosus (LeConte) except summit more distinct; posterior areas finely reticulate, punctures very fine, widely spaced. Glabrous except at margins.

Elytra 1.8 times as long as wide, 1.4 times as long as pronotum; sides straight and parallel on basal two-thirds, rather narrowly rounded behind; striae not impressed, punctures fine, distinct, regular; interstriae subshining, with irregular lines, impressed points almost obsolete, punctures absent. Declivity rather steep, convex; surface somewhat shagreened, subshining; strial punctures almost obsolete, usually visible, impressed points obscure to rather conspicuous; shallowly, distinctly sulcate between interstriae 3,3 with two or three small, rounded granules. Glabrous except for sparse hair on declivity and sides.

Male.-Similar to female except antenna without long hair; declivital sulcus not as deep, granules on interstriae 3 smaller.

Distribution.- South Dakota and Nova Scotia to Texas and Florida; Dominican Republic and France.

CANADA: New Brunswick, Nova Scotia, Ontario, Quebec. USA: Alabama, Arkansas, District of Columbia, Florida, Georgia, Louisiana, Maine, Massachusetts, Michigan, Minnesota. Mississippi, Missouri, New Hampshire, New Jersey, New York, North Carolina, Ohio, Pennsylvania, South Carolina, South Dakota, E Texas, Virginia, Vermont, West Virginia, Wisconsin. OTHER COUNTRIES: Dominican Republic, France.

Hosts.-Pinus echinata, P. ponderosa, P. strobus, P. taeda, and Picea sp.

Biology.- As described for the genus.
Notes.- A specimen in the U.S. National Museum obtained from the Fitch collection is believed to be the holotype of this species. The above treatment was based on the Fitch specimen, on my specimens compared to it, and on 662 other specimens.

## 7. Gnathotrichus nitidifrons Hopkins

Gnathotrichus nitidifrons Hopkins, 1905, preprint of Proc. Ent. Soc. Washington 7:72 (Holotype, female; Michoacán, Mexico; U.S. Nat. Mus., 7510)
Diagnosis.- This species is distinguished from materiarius (Fitch) by the frons, by the more numerous, finer, impressed lines on the elytral disc, and by the declivity.

Female.- Length 2.7-3.0 mm, 3.1 times as long as wide; color dark brown.

Frons as in materiarius except more brightly shining, median line broadly impunctate and largely or completely, broadly, weakly elevated.

Pronotum as in materiarius except punctures on disc more nearly obsolete.

Elytra as in materiarius except strial punctures smaller, impressed lines on disc finer, more numerous, declivity feebly bisulcate, suture as high as lateral convexities on upper half, higher on lower half, interstrial granules smaller, more numerous, surface usually more brightly shining.

Male.-Similar to female except setae on antennae much shorter.

Distribution.- Durango and Hidalgo to Guatemala.

MEXICO: Durango: 16 km W El Salto, VII-64. Pinus cooperi, J. B. Thomas. Hidalgo: 8 km W Tulancingo, 11 -VI-67, P. lciophylla, S. L. Wood. Mexico: San Rafael. 11-IX-49, P. lciophylla, J. P. Perry; El Telar, 15-I-69, P. montezumae, R. Rodrequez; Tlalmonalco, 20-XI-49, P. leiophylla, J. P. Perry. Michoacán: Uruapan. GUATEMALA: Cerro Zunil; San Gerónimo.

Hosts.- Pinus cooperi, P. leiophylla, P. montezumae.

Biology.- Specimens were taken from logs. The habits apparently are as described for the genus.

Notes.- The above treatment was based on the holotype and on eight other specimens.

## 8. Gnathotrichus deleoni Blackman

Gnathotrichus delconi Blackman, 1942, Proc. U.S. Nat. Mus. 92:227 (Holotype, male; Chalco, Distrito Federal, Mexico: U.S. Nat. Mus., 55997)
Diagnosis.- This species is distinguished from nitidifrons Hopkins by characters summarized in the above key.

Female.- Length 2.8-3.3 mm, 3.0 times as long as wide; color dark brown.

Frons similar to nitidifrons but more evenly convex, median area not elevated, often
impunctate. Pronotum 1.1 times as long as wide, as in uitidifrons except sides more nearly arcuate and summit much less definite.

Elytra 1.8 times as long as wide, 1.7 times as long as pronotum; sides straight and parallel on basal two-thirds, rather narrowly subangulate behind; striae not impressed, variable, punctures minute to obsolete, usually visible toward base, often obsolete toward declivity; interstriae shining, irregular lines and impressed points rather abundant. Declivity rather steep, evenly convex; not at all sulcate; strial punctures obsolete; minute granules evident on interstriae 2 and 3 , impressed points conspicuous; suture feebly elevated on lower third. Vestiture of sparse, fine, long hair on declivity.

Male--Similar to female except antenna without long hair; frons finely aciculate from upper level of eyes to epistoma; discal striae usually less distinct.

Distribution.- Durango to Mexico and Tlaxcala.

MEXICO: Distrito Federal: Chalco, Pimus leiophylla, D. DeLeon. Durango: 9 km NE El Salto, 23-VII-53, Pinus, S. L. Wood: 5 km W (No. 40 ) and $29 \mathrm{~km} W$ (No. 39) El Salto, 7-VI-65, 2500 m , Pinus, S. L. Wood. Mexico: San Rafael, I6-IX-49, P. leiophylla, P. J. Perry; Tlahnanalco, I0-VII-49. P. leiophylla. P. J. Perry. Tlaxcala: Villareal, 4-VIII-78, pheromone trap, M. M. Furniss.

Hosts.-Pinus leiophylla, P. sp.
Biology.- Specimens were taken from shaded out limbs 5 to 10 cm in diameter. Otherwise the habits are as described for the genus.

Notes.- The above treatment was based on the holotype and on 42 other specimens.

## 9. Gnathotrichus perniciosus Wood

Gnathotrichus perniciosus Wood, 1967, Great Basin Nat. 27:47 (Holotype, male; 6 miles or 9 km S Carapan, Michoacán, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from retosus (LeConte) and denticulatus Blackman by the smaller size, by the less strongly impressed declivity, and by the strongly aciculate frons.

Male.- Length 2.2-2.6 mm, 3.2 times as long as wide; color dark brown, elytral bases somewhat lighter.

Frons moderately convex; surface convergently aciculate from upper level of eyes
to median point on epistoma, two of these ridges on median line (one in some paratypes) more strongly raised, particularly above, grooves between ridges and above aciculate area rather sparsely, deeply, coarsely punctured.

Pronotum 1.2 times as long as wide; widest at base, sides straight, converging very slightly on basal three-fourths, then broadly rounded in front; anterior margin armed by about 12 low, blunt serrations; summit well in front of middle, marked by a raised transverse line; posterior area finely reticulate, dull, very finely, rather sparsely punctured; vestiture inconspicuous, confined to sides.

Elytra 1.8 times as long as wide; sides almost straight and parallel on basal threefourths, narrowly rounded behind, with a very small notch at suture; striae not impressed, punctures in semidefinite rows, small, shallow; interstriae with surface lines, points, and an occasional puncture, subshining. Declivity steep, narrowly, shallowly sulcate; striae 1 and 2 indicated by fine, shallow punctures; interstriae 1 and 2 very narrow, impressed, 3 moderately, rather abruptly elevated and armed by about four small, rounded granules. Vestiture limited to declivity, fine, hairlike, short and a few longer setae intermixed.

Female.-Similar to male except outer margin of antemal funicle and club bearing a few long setae.

Distribution.- Sinaloa and Chihuahua to Honduras.

MENICO: Chiapas: Bochil, Lagos des Colores, San Cristóbal de las Casas. Chihuahua: Tres Ríos. Distrito Federal: El Guarda. Jalisco: Mazamitla. Michoacán: Carapan, Mt. Colima. Morelos: Cuernavaca. HON DURAS: Cerro Peña Blanca, San Lucas and Yuscarán in Paraiso.

Hosts.- Pinus chiapensis, P. leiophylla, P. montezuma, P. oocarpa, P. pseudostrobus, P. spp.

Biology.- As described for the genus; most specimens were taken from the bole of standing, dying trees larger than 20 cm in diameter.

Notes.- The above treatment was based on the type series of 81 specimens, and on 12 other specimens.

## 10. Gnathotrichus retusus (LeConte)

Cryphalus retusus LeConte, 1868, Trans. Amer. Ent. Soc. 2:155 (Lectotype, female; California; Mus. Comp. Zool., 1010, present designation)
Gnathotrichus retusus: Eichhoff, 1878, preprint of Mém. Soc. Roy. Sci. Liége (2)8:407
Gnathotrichus alni Blackman, 1931, J. Washington Acad. Sci. 21:271 (Holotype, female; Hoquiam. Washington; U.S. Nat. Mus., 43431); Wood, 1977. Great Basin Nat. 37:512. Synonymy
Diagnosis.- This species is distinguished from denticulatus Blackman by the weakly aciculate frons near the epistoma, by the more deeply sulcate declivity, with more abruptly elevated lateral convexities, by the slightly larger average size, and by the distribution.
Female.- Length $3.3-3.7 \mathrm{~mm}, 3.1$ times as long as wide; color dark brown.

Frons broadly convex, ascending slightly toward median area of epistoma, elevated area weakly aciculate, surface subshining, smooth, punctures rather small, moderately abundant; vestiture of fine, sparse, inconspicnous hair.

Pronotum 1.3 times as long as wide; outline as in nitidifrons Hopkins; summit transversely subcarinate; posterior area finely reticulate, punctures rather fine, not close.

Elytra 1.9 times as long as wide, 1.4 times as long as pronotum; sides straight and parallel on more than basal two-thirds, rather broadly rounded behind; striae not impressed, punctures rather small, deep, regular, in rows; interstriae smooth, shining, at least four times as wide as striae, with numerous impressed points, punctures absent. Declivity steep, rather deeply sulcate; strial punctures much smaller than on declivity, surface densely marked by impressed points; sulcus deep, lateral areas rising abruptly from striae 1 , summit on 3 armed by a row of rather coarse, pointed granules. Vestiture largely confined to declivity, of sparse, coarse hair.

Male- Similar to female except antenna without long hair.

Distribution.- British Columbia and northwestern Utah to Baja California.

CANADA: British Columbia: Agassiz, Bowser, Creston. Duncan, Lake Cowichan, Merritt, Nelson. Pender Harbor, Terrace, Trenchan, Todd Inlet. Trinity Valley, Victoria. USA: California: more than 100 localities. Idaho: Cedar Mit., Centerville, Coeur d'Alene, Moscow, Pierce, Smiths Ferry, Troy, Westmond, Whitebird Pass.

Montana: Sula. Nevada: Carson City, Kyle Canyon in Clark Co. Oregon: more than 40 localities. Utah; Logan Canyon. Washington: more than 35 localities. MEXICO, Baja California: Laguna Hanson, San Juárez, San Pedro Mártir.

Hosts.-Alnus sp. (seven series in Oregon and Washington), Picea engelmannii, Pinus contorta, P. flexilis, P. jeffreyi, P. radiata, P. ponderosa, Populus trichocarpa (one series from Longmire, Washington), and Pseudotsuga menziesii.

Biology.- As described for the genus.
Nores.- The above treatment was based on the 2 syntypes of retusus in the LeConte collection, on the holotype of alni, and on 994 other specimens. The first syntype in the LeConte collection, a female from California, is here designated as the lectotype of retusus LeConte. It was labeled "Type" many years ago, but was never officially so designated.

Long series from alder and from coniferous hosts from Oregon and Washington were compared, but 1 fail to see characters that distinguish species. The possibility that a sibling species exists in alder requires further investigation. It is also possible that retusus and denticulatus intergrade in Utah or Wyoming; however, these species are very rare in this area, and specimens even suggesting intergradation were not seen.

## 11. Gnathotrichus denticulatus Blackman

Gnathotrichus denticulatus Blackman, 1931. J. Washington Acad. Sci. 21:270 Holotype, female; Cloud(roft, New Mexico; U.S. Nat. Mus., 43430)
Diagnosis.- This species is distinguished from retusus (LeConte) by the entirely smooth, nonaciculate frons, by the less strongly sulcate declivity, by the smaller average size, and by the distribution.

Female. - Length 2.8-3.3 mm, 3.1 times as long as wide; color dark brown:-

Frons as in retusus except entirely devoid of all traces of aciculation. Pronotum and elytra as in retusus except elytral declivity much less strongly sulcate.

Male.-Similar to female except antenna without long hair.

Distribution.- E Utah and South Dakota to Michoacán and Puebla.

USA: Arizona: Chiricahua Mts., Flagstaff. Jerome, Kaibab N.F., Paradise, Prescott N.F., Rincon Mts.. San Francisco Peak, Santa Catalina Mits., Sitgreaves N.F., White River. Williams. Colorado: Colorado N.F., Colorado Springs, Estes Park, Evergreen, Fort Collins,

Glennhaven, Gunnison, Norwood, Ouray, Uncompahgre N.F., Waldo Canyon. New Mexico: Capitan, Cloudcroft, Magdelena, Meek, Vermejo. South Dakota: Black Hills, Cheyenne Crossing, Elmore, Hill City. Texas: Davis Mts. Utah: Dixie N.F., Elk Park in Ashley N.F., Long Hollow in Dixie N.F., Panguitch. MEXICO: Chihuahua: Ojinaga. Distrito Federal: El Guarda. Durango: Durango, El Salto. Guerrero: Acapulco. Michoacán: Carapan. Puebla: Texmelucán. San Luis Potosí: San Luis Potosí.

Hosts.- Picea engelmannii (accidental?), Pinus ponderosa, $P$. spp.

Biology. - As described for the genus. Most specimens were taken from the stump of standing, dying trees.

Notes.- The above treatment was based on the holotype and on 216 other specimens.

## 12. Gnathotrichus imitans Wood

Gnathotrichus imitans Wood, 1967, Great Basin Nat. 27:48 (Holotype, male; 3 miles or 5 km W El Salto, Durango, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from omissus Wood and sulcatus (LeConte) by the smooth, shining pronotal disc, with much larger punctures, by the arcuate impression on the upper frons, and by the steeper, more broadly rounded elytral declivity.

Female. - Length $2.8-3.1 \mathrm{~mm}, 3.3$ times as long as wide; color brown to almost black.

Frons impressed on more than median half from upper level of eyes to epistoma, convergently aciculate toward median point on epistomal margin on most of impressed area; surface coarsely, rather sparsely, deeply punctured over most of front of head to vertex; a median carina extending dorsal from upper level of eyes; vestiture sparse, inconspicuous.

Pronotum 1.4 times as long as wide; widest at base, sides almost straight on basal threefourths and slightly converging anteriorly, rather broadly rounded in front; anterior margin with an irregular, indistinctly serrate, raised rim; summit well in front of middle, clearly marked by a transverse elevation; posterior area almost smooth and shining, rather closely, deeply, finely punctured; vestiture restricted to sides.

Elytra 1.9 times as long as wide; sides straight and subparallel on basal threefourths, rather narrowly rounded behind; striae not impressed, punctures small, deep; interstriae little wider than striae, marked by
a few surface lines and points, subshining. Declivity moderately steep, convex; all punctures minute, not clearly impressed; interstriae 1 weakly elevated, 2 impressed, 3 slightly elevated and armed by a series of about five very small granules; apical margin not extended as in most representative of the genus. Vestiture confined to sides and declivity; longer and in distinct rows on declivital interstriae 3 and 4 .

Male.- Similar to female in all respects.
Distribution.- Arizona and New Mexico to Durango and Hidalgo.

USA: Arizona: Onion Saddle, Chiricahua Mts., 30-VI53, W. F. Barr; Williams, 1-VII, J. N. Knull. New Mexico: Cloudcroft, 2-VIII-51, Hopk. U.S. 34218D4, Pinus pondcrosa. MEXICO: Durango: 5 km W El Salto, 7 -VI$65,2500 \mathrm{~m}$, in flight, S. L. Wood, also 3-VI-37, Juan Manuel, also 16 km W, VII-64, in flight, J. B. Thomas. Hidalgo: 31 km E Tulancingo, 10-V11-67, 2300 m , No. 185, Pinus, S. L. Wood.

Host.- Pinus ponderosa, P. sp.
Biology.- Specimens taken by me were in a $\log 40 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 80 specimens and on 16 other specimens.

## 13. Gnathotrichus sulcatus (LeConte)

Cryphalus sulcatus LeConte, 1868, Trans. Amer. Ent. Soc. 2:155 (Holotype, female; middle California; Mus. Comp. Zool., 1001)
Gnathotrichus sulcatus: Eichholf, 1878, Mém. Soc. Roy. Sci. Liége (2)8:407
Gnathotrichus aciculatus Blackman, 1931, J. Washington Acad. Sci. 21:272 (Holotype, female; Cloudcroft, New Mexico; U.S. Nat. Mus., 43432); Wood, 1977, Great Basin Nat. 37:5I3. Synonymy
Diagnosis.- This species is distinguished from omissus Wood by the more coarsely aciculate female frons, by the more finely sculptured elytral disc, by the more deeply impressed elytral declivity, with more conspicuously marked striae, and by the hosts and distribution.

Female. - Length 2.8-3.5 mm, 3.1 times as long as wide; color dark brown.

Frons convex, shining, rather strongly aciculate on more than medium half to well above eyes, small punctures interspersed; vestiture of sparse, fine, inconspicuous hair.

Pronotum as in omissus except summit more conspicuous, transversely subcarinate.

Elytra as in omissus except punctures slightly smaller, impressed lines less
conspicuous, evidently less numerous, impressed points smaller; declivital sulcus rather strongly impressed, granules larger, strial punctures more distinct, in rows.

Male.-Similar to female except antenna without long hair; anterolateral angles of pronotum with a small, obscure tuft of hair.

Distribution.- British Columbia and South Dakota to Honduras.

CANADA: British Columbia: Duncan, Genoa Bay, New Westminister, Pender Harbor, Vancouver, Victoria. USA: Arizona: Chiricahua Mts., Flagstaff, Graham Mts., Huachuca Mts., Jacob’s Lake, Kaibab N.F., Santa Catalina Mts., Williams. California: The counties of Eldorado, Fresno, Humboldt, Lassen, Marin, Mendocino, Modoc, Monterey, Nevada, Dumas, San Mateo, Santa Cruz, Siskiyou, Trinity, Tulare. Colorado: Pitkin, Poudre Canyon in Larimer Co. Idaho: Coeur d'Alene, Krassel. Nevada: Lake Tahoe. New Mexico: Albuquerque, Cloudcroft, Las Vegas Hot Springs, Sandia Mts. Oregon: Ashland, Astoria, Bly, Burn, Corvallis, Grants Pass, Mary's Peak, Marslifield, North Plains, Portland. South Dakota: Black Hills, Elmore. Utah: Beaver, Sanford Canyon in Dixie N.F., Payson Canyon. Washington: Aberdeen, Buckeye, Hoquiam, Kent, Olympic N.F., Satsop. MEXICO: Distrito Federal: El Guarda. Durango: Durango, El Salto. Hidalgo: Tulancingo, Zacatlán. Michoacán: Ciudad Hidalgo, Morelia. Oaxaca: Oaxaca. Puebla: Texmelucán. Tlaxcala: Tlaxco. Veracruz: Jalapa, Perote. GUATEMALA: Solola. HONDURAS: Cerro Pena Blanca.
Hosts-Abies concolor, A. magnifica, A. religiosa, Pinus leiophylla, P. ponderosa, P. pseudostrobus, P. spp., Pseudotsuga menziesii, Tsuga heterophylla.

Biology.- As described for the genus.
Notes.- The above treatment was based on the holotypes of sulcatus and aciculatus, and on 594 other specimens. Blackman named aciculatus from specimens having the declivital sulcus much more conspicuously impressed than in most specimens. This character apparently varies within and between series. With the material at hand, this character could not be correlated with other factors useful in separating species. There is a possibility that geographical races exist having distributions approximately as in retusus and denticulatus, but they must be defined by characters other than those used by Blackman for sulcatus and aciculatus.

## 14. Gnathotrichus omissus Wood

[^22]Diagnosis.- This species is distinguished from sulcatus (LeConte) by the minute to obsolete strial punctures on the disc, by the confused punctures on the elytral declivity, by the feebly impressed elytral declivity, by the much less strongly aciculate female frons, and by the hosts.

Female.- Length 3.3-3.6 mm, 3.2 times as long as wide; color dark brown, usually with pale areas on anterior pronotum and basal and declivital areas of elytra.

Frons convex, median line obscurely elevated, surface smooth, shining, sparsely, finely punctured, median third below upper level of eyes finely aciculate; vestiture fine, sparse, inconspicuous.

Pronotum 1.3 times as long as wide; essentially as in materiarius (Fitch) except serrations on anterior margin coarse.

Elytra 1.8 times as long as wide, 1.5 times as long as pronotum; outline as in materiarius; striae not impressed, punctures small, in slightly irregular rows; interstriae smooth, shining, impressed lines and points moderately abundant. Declivity rather steep, convex; weakly, rather narrowly sulcate; strial punctures obsolete or nearly so, evidently confused; lateral convexities distinctly higher than suture, summit armed by two or three small granules. Vestiture confined to declivity, consisting of sparse hair.

Male.- Similar to female except frontal aciculation much stronger and distributed almost from eve to eye to well above eyes; antenna without long hair; anterolateral angles of pronotum bearing a small tuft of hair.

Distribution.-Guatemala to Costa Rica.
GUATEMALA: Volcán Pacaya, Esquintla, 1-V1-64, 1300 m , No. 688, Caldo de Frijol, S. L. Wood. COSTA RICA: Volcán Irazu, Cartago, 26-1X-63, 2300 m, No. 207, Oreopanax nubigenus, S. L. Wood.

Hosts.- Oreopanax nubigemus, etc.
Biology.- Specimens were attacking limbs 15 cm in diameter.

Notes.- The above treatment was based on the type series of 40 specimens and on one other specimen.

## 15. Gnathotrichus consentaneus Blandford

Gnathotrichus consentaneus Blandford, 1904. Biol. Centr. Amer., Coleopt. 4(6):247 (Lectotype, male; Totonicipan, Guatemala; British Mus. Nat. Hist., designated by Wood, 1973, Great Basin Nat. 33:176)

Diagnosis.- This species is distinguished from omissus Wood by the much larger size, by the larger, pointed, recurved declivital tubercles, and by the more broadly impressed elytral declivity.

Female.- Length 4.1-4.3 mm, 3.6 times as long as wide; color dark brown, basal half of elytral disc lighter.

As in omissus except elytral declivity somewhat more broadly impressed, and interstriae 3 at base armed by two pairs of small, sharply pointed, recurved (hooked) denticles.

Male.- Similar to female except antenna without long hair.
Distribution.- Chiapas to Guatemala.
Mexico: Chiapas: Mt. Tzontehuiz. GUATEMALA: Totonicipan, G. C. Champion.

Notes.- Blandford included at least 18 specimens under this name when it was described, but stated that it was named from the Totonicipan series. Pins 1, 7, and 8 bear specimens from Totonicipan and are consentaneus; pins 3 and 5 and one in the Schedl collection bear specimens from Totonicipan of sulcatus (LeConte); pin 4 from Teapa, pins 6 and 15 from Mexico by Truqui, pin 11 from the Quiché Mts., and pin 14 from Volcán de Agua bear specimens of sulcatus; pin 9 from Cerro Zunil and pin 13 (2 specimens) from San Geronimo bear specimens of nitidifrons Hopkins; pin 10 from Cerro Zunil and pin 12 from Omilteme bear specimens of perniciosus Wood; and pin 2 ( 2 specimens) from Mercedes bears specimens Xyleborus declivis Eichhoff. The first specimen in the series, a male from Totonicipan, bears a type label and has been regarded as the type for many years; it was designated as the lectotype of consentaneus Blandford as cited above.

This large species probably infests a nonconiferous host.

## Genus GNATHOTRUPES Schedl

Gnathotrupes Schedl, 1951, Dusenia 2:125 (Type-species: Gnathotrupes bolivianus Schedl, monobasic) Gnathotrypanus Wood, 1968, Great Basin Nat. 28:9 (Type-species: Gaathotrypanus tercbratus Wood, original designation); Wood, 1973, Great Basin Nat. 33:172. Synonymy
Diagnosis.- This genus is distinguished from Gnathotrichus Eichhoff by the more strongly arched sutures of the antennal club, which are more closely, more conspicuously
marked by rows of setae, by the smaller segment 1 of the antennal club, by the abrupt, flattened elytral declivity, with the sutural apex broadly angulate, the costal margin near the sutural apex not elevated, and by the distribution.

Description.- Length $1.3-2.6 \mathrm{~mm}$ (some South American species much larger), 2.4-3.2 times as long as wide; color dark brown.

Frons indistinctly to profoundly dimorphic, males convex, females convex with sparse setae to strongly concave and elaborately ornamented by hair; eye shallowly to moderately emarginate; pregula normal to variously extended toward the occipital foramen, several species with well-developed gula marked off by two completely separate gular sutures. Antennal scape elongate, club shaped; funicle 5 -segmented; club subcircular to elongate, sutures 1 and 2 strongly arcuate to angulate, segment 1 usually small. Pronotum much longer than wide, summit anterior to middle, usually indefinite; anterior slope moderately asperate, anterior margin serrate; posterior areas very finely sculptured. Scptellum rather large, flat. Elytra elongate, declivity steep, costal margin ascending from base of declivity to sutural apex, its margin not acutely elevated near suture. Prothoracic precoxal piece forming a simple transverse partition between head and coxae, not extended between coxae (an extension does occur in some South American species). Legs as in Gnathotrichus.

Distribution.-Guatemala to Argentina; 15 species are known; 5 occur in Central America.

Biology.- Apparently as described for Gnathotrichus.

Notes.- All South American species of Gnathotrichus have been referred to Gnathotrupes (Wood 1973:172). Of the 13 species of Gnathotrupes before me, 5 species have a complete gula extending from pregula to postgula, with two completely separate gular sutures, 5 species have the pregula extending more than half the distance from its normal position to the foramen magnum, and 3 species have a normal pregula. This is the only genus of Scolytidae known to me in which there is a complete gula.

## Key to the Species of Gnathotrupes

1. Strial punctures small, in definite rows; upper third or more of elytral declivity sulcate, its lateral convexities armed by pointed granules; body stouter, not more than 2.5 times as long as wide (except bituberculatus); anterolateral angles of female pronotum usually bearing a conspicuous tuft of hair; erect declivital setae stout, almost scalelike

- Elytral punctures on disc confused or not; declivity flat or slightly convex, not at all sulcate, lateral areas armed or not; costal margin of elytra ascending from basal margin of declivity to sutural apex; body slender, more than 3.0 times as long as wide; anterolateral angles of female pronotum without a tuft of hair 4

2(1). Sutures of antennal club strongly procurved or angulate, 2 obsolete at its middle; elytral declivity more strongly sulcate almost to apex, lateral margins on interstriae 3 armed by a row of several (about five) granules, about half of them on lower half of declivity; Costa Rica; 2.4 mm $\qquad$ 2. electus (Wood)

- Sutures of antennal club straight to moderately procurved; declivital sulcus shallow, confined to basal half, interstriae 3 armed on basal half by fewer than five pairs of small tubercles 3
3(2). Smaller; vestiture on elytral declivity of very fine, short hair and slightly longer scales; declivital interstriae 3 near base armed by a row of four or five small, pointed tubercles; sutural apex entire; female frons subglabrous; Costa Rica; $1.3-1.5 \mathrm{~mm}$ 1. terebratus (Wood)
- Larger; vestiture on declivity of short, rather stout bristles; declivital interstriae 3 with a moderately large, blunt tubercle slightly above middle, one or two small granules on basal half; sutural apex moderately divaricate in female, strongly divaricate in male; female frons ornamented by long hair; Guatemala; $2.4-2.6 \mathrm{~mm}$

3. bituberculatus (Blandford)

4(1). Elytral declivity broadly convex, unarmed, with rather abundant, moderately long pubescence; punctures on frons sparse, rather coarse; Costa Rica; 1.6-1.7 mm
4. dilutus Wood

- Elytral declivity flattened, interstriae 3 armed by two pairs of pointed denticles, pubescence short; punctures on frons sparse, minute; Costa Rica; 1.9-2.0 mm

5. crecentis Wood

## 1. Gnathotrupes terebratus (Wood)

Fig. 218
Gnathotrupanus terebratus Wood, 1968, Great Basin Nat. $28: 9$ (Holotype, male: Volcán, Puntarenas, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from electus (Wood) by the smaller size, by the very different antennal club, and by the different elytral declivity.

Female.- Length 1.30-1.45 mm, 2.5 times as long as wide; color dark reddish brown, pronotum yellowish brown.

Frons weakly convex to well above eyes on an area slightly less than distance between eyes, very feebly elevated toward a broad,
low, median, longitudinal elevation; surface very obscurely reticulate with a few very coarse, deep punctures, except shining and impunctate on median elevation; vestiture inconspicuous. Eye half divided by an emargination. Antennal scape about as long as 5segmented funicle, about half as long as club; club as long as wide, with two procurved, almost angulate sutures, 1 extending one-fourth club length from base, 2 extending slightly more than half club length from base, most of 1 and extreme margins of 2 septate.

Pronotum 1.1 times as long as wide; widest on basal half, sides almost parallel, very feebly arcuate to just before middle, then
distinctly converging to rather abrupt anterolateral angles, very broadly rounded, almost straight in front; anterior margin armed by about 14-16 low teeth; indefinite summit in front of middle, moderately declivous and finely asperate anterior to summit; posterior area minutely subreticulate, with an occasional minute puncture. A few hairlike setae in asperate area and on lateral areas; anterolateral angles bearing small tuft of yellow hair.

Elytra 1.4 times as long as wide, 1.3 times as long as pronotum; sides almost straight and parallel on basal three-fourths, very broadly rounded behind; striae not impressed, punctures minute, shallow; interstriae about three times as wide as striae, shining, marked by rather numerous lines, punctures not evident. Declivity steep, confined to posterior fourth of elytra; shallowly, subconcavely impressed on central two-thirds, except sutural area above impressed; striae obsolete; declivital face closely, minutely marked by indefinite, confused punctures; position of interstriae 2 near upper margin armed by a series of two or three small pointed tubercles, third tubercle almost one-fourth of declivital length from base of declivity; apical, costal margin near suture finely, weakly elevated. Vestiture confined to declivity, consisting of fine hair and erect, slightly longer scales in about equal numbers; rather sparse.

Male.- Similar to female except frons flattened to well above eyes; frontal setae shorter; anterolateral angles of pronotum without tufts of hair.

Distribution.- Costa Rica.
COSTA RICA: Volcán, Puntarenas, 11-Xil-63, 1000 m. No. 307, Guarumo, S. L. Wood.

Host.- Presumably Pourouma aspera.
Biology.- Specimens were just entering a recently cut bole 20 cm in diameter.

Notes.- The above treatment was based on the type series of 26 specimens.

## 2. Gnathotrupes electus (Wood)

Gnathotrypanus electus Wood, 1968, Great Basin Nat. 28:10 (Holotype, female; Rincón de Osa, Puntarenas, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from terebratus (Wood) by the larger size, by the very different antennal club, and by the different elytral declivity.

Female.- Length $2.4 \mathrm{~mm}, 2.4$ times as long as wide; color reddish brown, with elytra much darker.

Frons moderately convex, with median line rather narrowly elevated, particularly toward epistomal margin; surface dull, very finely, rather closely punctured; vestiture inconspicuous, antennal club with sutures strongly procurved, more narrowly angulate than in terebratus.

Pronotum 1.1 times as long as wide; sides very feebly arcuate, almost parallel on basal half, rather broadly rounded in front; anterior margin not clearly armed, posterior area minutely reticulate, finely punctured. Subglabrous except at lateral and anterior margins; a moderately large patch of rather long, conspicuous, hairlike setae on anterolateral angle.

Elytra about 1.4 times as long as wide (elytra of holotype slightly spread), 1.2 times as long as pronotum; sides almost straight and evidently parallel on about basal threefourths, very broadly rounded behind; striae not impressed, punctures small, distinct, shallow; interstriae about three times as wide as striae, surface shining, marked by lines and exceedingly minute points, with punctures similar in size and spacing to those of striae. Declivity steep, sulcate; striae not indicated, surface finely reticulate, with very obscure, confused, close punctures indicated; rather strongly impressed between third interstriae, lateral elevations moderately abrupt, broad, armed by one small, pointed tubercle near upper margin and four similar tubercles on middle third, upper one of these four larger. Vestiture confined to declivity, consisting of fine, semirecumbent hair and a few erect, slender scales.

Distribution.- Costa Rica.
costa rica: Rincón de Osa, Puntarenas, 11-vili$67,30 \mathrm{~m}$, No. 88 , tree limb, S. L. Wood.

Notes.- The above treatment was based on the unique holotype.

## 3. Gnathotrupes bituberculatus (Blandford)

Gnathotrichus bituberculatus Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):248 (Lectotype, female; Purulha, Baja Vera Paz, Guatemala; British Mus. Nat. Hist., present designation)
Diagnosis.- This species is distinguished as indicated in the above key.

Female.- Length 2.6 mm (male 2.4 mm ), 3.2 times as long as wide; color light brown, anterior third of pronotum and elytral declivity dark brown.

Frons very broad, weakly convex, evidently subreticulate; epistomal area slightly elevated, its median fourth shining; pubescent on median two-thirds except for glabrous central area, setae moderately long, rather abundant; upper half concealed on type by pronotum. Aritennal club rather small, sutures very weakly procurved.

Pronotum 1.4 times as long as wide; sides straight and parallel on anterior threefourths, very broadly rounded in front; serrations on anterior margin almost obsolete; summit on anterior third, indefinite; posterior areas reticulate, punctures very fine, obscure. Glabrous.

Elytra 1.9 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal five-sixths, rather abruptly, very broadly rounded behind; dise shining, almost smooth, strial punctures very small, not always clearly impressed, interstrial punctures obsolete. Declivity very steep, broadly, rather weakly convex, feebly sulcate on upper half; interstriae 3 armed by a conspicuous, rather small, blunt tubercle very slightly above middle, 1 to 4 minute tubercles on basal half of interstriae 3; lateral areas with several very minute granules; surface reticulate; sutural apex rather deeply divaricate. Vestiture confined to declivity, of coarse, short bristles.

Male. - Similar to female except frons rather coarsely punctured, subglabrous; anterior margin of pronotum armed by 14 coarse serrations; elytral declivity with margins more abrupt, strial punctures clearly visible on upper third, major tubercles more nearly pointed, declivital surface smooth, shining, suture much more broadly, deeply notched, setae shorter, broader.
Distribution.- Guatemala.
GUatemala: Purulhá, Baja Vera Paz, G. C. Champion.

Notes.- The above treatment was based on the two syntypes. The female syntype is here designated as the lectotype of Gnathotrichus bituberculatus Blandford and this species is transferred to Gnathotrupes.

## 4. Gnathotrupes dilutus Wood

Gnathotrupes dilutus Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):56 (Holotype, female; Tapantí, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from crecentis Wood by the broadly convex unarmed elytral declivity, with longer declivital pubescence, by the larger frontal punctures, and by the smaller size.

Male.-Length $1.6-1.7 \mathrm{~mm}, 3.2$ times as long as wide; color dark brown.

Frons broadly convex, shining, weakly reticulate; punctures sparse, moderately coarse, shallow; epistomal area distinctly impressed except on median line; vestiture sparse, hairlike, inconspicuous. Antennal club subcircular, three strongly arcuate sutures marked by grooves and rows of setae, segment l very small.

Pronotum 1.2 times as long as wide; sides feebly arcuate, subparallel on more than basal half, broadly rounded in front; anterior margin armed by 14 serrations; indefinite summit well in front of middle; anterior slope rather abrupt, rather coarsely asperate; posterior areas subreticulate (mostly wavy lines), punctures very minute, sparse. Glabrous.

Elytra 1.9 times as long as wide, 1.6 times as long as pronotum; sides almost straight and parallel on more than basal three-fourths, very broadly rounded behind; striae not impressed; surface shining, almost smooth, punctures minute, almost obsolete, confused. Declivity confined to less than posterior fourth, very steep, broadly convex; punctures larger and deeper than on disc, confused. Vestiture confined to declivity, of rather abundant, fine, short, and rather long hair.

Distribution.- Costa Rica.
COSTA RICA: Tapantí, Cartago, 17-IN-63, 1300 m , No. 184, Miconia caudata, S. L. Wood.

Biology.- Males were just entering a recently cut branch 10 cm in diameter.

Notes.- The above treatment was based on the type series of three males.

## 5. Gnathotrupes crecentus Wood

Gnathotrupes crecentus Wood, 1974, Brigham Young Univ. Sci. Bull. Biol. Ser. 19(1):56 (Holotype, female; Volcán, Puntarenas, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from dilutus Wood by the steep, almost flat
elytral declivity that is armed by two pairs of moderately large tubercles on interstriae 3, by the very short declivital vestiture, by the much finer frontal punctures, and by the smaller size.

Female.- Length $1.9-2.0 \mathrm{~mm}, 3.0$ times as long as wide; color dark brown.

Frons as in dilutus except punctures very fine; sparse setae very long. Pronotum as in dilutus.

Elytral outline as in dilutus; strial punctures very small, in definite rows; declivity steeper and much flatter than in dilutus, punctures larger, confused, interstriae 3 with two pointed denticles one-third and twothirds declivital length from base. Vestiture mostly very short, a few longer hairs.

Male.-Similar to female except lower half of frons more distinctly, transversely impressed, setae short; strial punctures minute, confused; declivital denticles slightly larger, punctures much smaller, vestiture shorter.

Distribution.- Costa Rica.
COSTA RICA: Volcán, Puntarenas, 11-XII-63, 1000 m, No. 308, tree limb, S. L. Wood.

Biology.- Specimens were taken from the wood of a recently cut limb $10-15 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 10 specimens.

## Genus TRICOLUS Blandford

Tricolus Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):286 (Type-species: Tricolus oticollis Blandford, subsequent designation by Hopkins, 1914, Proc. U.S. Nat. Mus. 48:131)
Diagnosis.- This genus is distinguished from Amphicranus Erichson by the more broadly rounded posterior margin of the elytra, which is feebly if at all explanate and feebly if at all divaricate, by the presence of three pairs of spines on the declivity, and by the somewhat distinctive precoxal piece on the prothorax.

Description.- Length $1.5-3.9 \mathrm{~mm}$, 2.4-3.4 times as long as wide; sexual dimorphism restricted to antennal vestiture; color uniformly brown or black to bicolored.

Frons convex, subglabrous, central area with a weakly elevated granular area, or rarely convergently aciculate; eye oval, emarginate, antennal socket in emargination; antennal scape elongate, funicle 3 -segmented, club elongate-oval to broadly subtriangular, sutures 1 and 2 septate, weakly to strongly procurved. Pronotum longer than wide, lateral margins marked by a fine raised line; sculpture conservative; anterior margin variable. Elytral disc with punctures small, confused; posterior area strongly impressed, lateral margin of declivity armed by three pairs of denticles (almost obsolete in three species); posterior margin weakly if at all explanate, usually not at all divaricate. Precoxal piece on prothorax a thin, transversely straight partition, usually partly bent from vertical to subhorizontal plane and pubescent. Tibiae not sexually dimorphic, usually with a marginal row and one submarginal row of tubercles on posterior face.

Distribution.- Nayarit and Veracruz to Bolivia and Brazil; about 30 species have been named; 24 species occur in Mexico and Central America.

Biology.- These monogamous ambrosia beetles occur in small recently cut or broken branches. The adult tunnel consists of a short radial entrance tunnel and a transverse brood gallery that follows a growth ring of the branch, at times forming a complete circle. Few young are produced in the parental tunnels. One species (cecropii) appears to have a mutualistic symbiotic or obligatory domicile parasitic relationship with a Corthylus species.

Notes. - Although the species assigned to this genus form a compact group, almost all characters of Tricolus intergrade with those of Amphicranus to such a degree that its validity is doubtful.

## Key to the Species of Tricolus

- Spine 3 on elytral declivity with a definite, small, pointed, subapical tubercle on its dorsomedian margin at or near apex

2(1). $\quad$| Spines on elytral declivity almost absent, poorly developed, represented by |
| :--- |
| feeble swellings or a broad fold; finely elevated line on declivital suture |
| continued on costal margin (see also cecropii) ................................................................ 3 |

- $\quad$| Declivital spines 1 and 2 clearly developed, pointed, 3 much larger (except in |
| :--- |
| cecropii), variously shaped; finely elevated line on declivital suture continued |
| on costal margin than curved dorsad at or near base of spine $3 \ldots . . . . . . . . . . . . . . . . . . . . . . . . . ~$ | 5

3(2). Impressed area on elytral declivity subcircular in outline, spine 1 at base of declivity small, sharply pointed; frons coarsely aciculate except for small, central, weakly raised granulate area; Guatemala to Costa Rica; Ficus; 1.8 mm

- Impressed area on elytral declivity conspicuously longer than wide, spine 1 represented by a small rounded granule or almost absent4

4(3). Smaller; body 3.1 times as long as wide; frons convex, granulate area weakly raised, lateral areas not impressed; median face of lateral convexities vertical from base to its posterior apex; Costa Rica; Siparuna; 1.8 mm
2. inornatus Wood

- Larger; body 2.8 times as long as wide; granular area on frons rather strongly elevated, lateral areas on lower half of frons impressed; mandibles enlarged; slope on median face of lateral convexities on declivity more gradual on basal half; Costa Rica; 2.6 mm

3. inaffectus Wood

5(2). Elytral declivity below spine 3 narrowly flattened, its width not exceeding width of impressed declivital area anterior to spine 3, subapical margin usually less strongly elevated, never reflexed upwards (explanate) so as to form an angle out of line with declivital slope of sutural area; granulate area on frons as long as wide or absent6

- Elytral declivity broadly flattened below spine 3, at least 1.3 times as wide as impressed area above spine 3 , if doubtful then granulate area on frons considerably wider than long; apical margin of declivity near suture often feebly explanate
6(5). Anterior margin of pronotum strongly produced, acutely angulate medially,
armed by very coarse, sharp serrations; spine 3 absent or long and slender ............ 7
- Anterior margin of pronotum rather narrowly to moderately rounded in front, serrations usually rather low, often indefinite; spine 3 stouter8

7(6). Body rather stout, dark brown; declivital spine 2 not larger than 1,3 represented by a simple fold, not projecting; granular area on frons large, wider than long, subreniform; Costa Rica; Cecropia petioles; 2.2-2.5 mm

- Body very slender, partly yellowish brown; declivital spine 2 cylindrical, much larger than 1,3 at least twice as long as wide, larger than 2; Costa Rica to Panama; 2.1-2.5 mm

- Spine 3 a definitely projecting process ........................................................................ 10
$9(8)$. Smaller; declivital spines 1 and 2 represented by small, rounded calluses; anterior margin of pronotum armed by nine coarse serrations; pronotum and elytra black; Costa Rica; 2.3 mm

6. parsus Wood

- Larger; declivital spines 1 and 2 each longer than their basal width; anterior margin of pronotum obscurely serrate; pronotum reddish brown, elytra black; Costa Rica; 2.7-3.1 mm
10(8). Declivital spine 3 very close to posterior margin, separated by a distance less
than half thickness of spine; color light brown; Costa Rica to Panama; 2.3-2.8
$\mathrm{mm} . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . ~ 8 . ~ b a d i u s ~ W o o d ~$
11(10). Declivital spine 3 stout, wider than long, somewhat laterally compressed, its apex at lower apical angle ..... 12
- Declivital spine 3 elongate, cylindrical, blunt, about twice as long as its basal width ..... 13
12(11). Larger; black; stouter, body 2.6 times as long as wide; granulate area on fronsindistinctly elevated; ?Veracruz, Guatemala to Costa Rica; 2.7-3.0 mm9. nodifer Blandford
- $\quad$ Smaller; rather dark brown; more slender, 2.8 times as long as wide; granulate area on frons distinctly elevated; Costa Rica; 1.7-1.8 mm 10. partilis Wood13(11). Punctures in excavated area of elytral declivity small, simple; frons devoid ofaciculate lines and elevations, granulate area conspicuously developed; CostaRica; 2.1 mm11. fenoris Wood
- Punctures on declivity with (at least) their anterior margins finely granulate;frons aciculate, granulate area absent; Puebla; 2.4 mm12. frontalis Wood
14(5). Raised granulate area on frons subcircular, about equal in length and width;spine 3 stout, its basal diameter from lateral aspect four or more times that ofspine 2; Panama; 2.1 mm13. capitalis Wood
- $\quad$ Raised granulate area on frons conspicuously wider than long ..... 1515(14). Subapical posterior margin of declivity uniformly rather weakly elevated andarcuate from suture to near lateral base of spine 3; color reddish brown; CostaRica; 2.3-2.6 mm14. saundersi Wood
- $\quad$ Subapical posterior margin of declivity abruptly, angulately produced near su-ture, forming a conspicuous sutural notch; color partly or entirely very darkbrown to black16
16(15). Spine 3 closer to raised angle on subapical margin than to spine 2; granulatearea on frons at least three times as wide as long, strongly constricted towardmedian line, its dorsal margin forming a broadly V-shaped angle; Costa Rica;$2.9-3.3 \mathrm{~mm}$15. naevus Wood- $\quad$ Spine 3 spaced by about equal distances from ventrolateral angle on subapicalmargin and from spine 2; granulate area on frons not more than twice as wideas long, not conspicuously constricted toward median line1717(16). Larger; spine 2 usually slightly closer to 3 than to 1 ; young adults with basalthird of elytra reddish brown, black elsewhere; sides on anterior third of pro-notum indistinctly constricted, more broadly rounded in front; Puebla to CostaRica; 2.6-2.9 mm
- $\quad$ Smaller; spine 2 spaced by about equal distances from spines 1 and 3; elytra of uniform color; sides on anterior third of pronotum distinctly constricted, nar-rowly rounded in front; Costa Rica to Panama and Venezuela; 1.9-2.3 mm

18(1). Subapical posterior margin of declivity rather weakly elevated, sutural emargination shallow, broad, much wider than deep; spine 3 projecting, more nearlycylindrical, except pernanulus; smaller than 3.1 mm19

| - | Subapical posterior margin of declivity more strongly elevated, sutural emargination very narrow, deeper than wide; spine 3 laterally compressed; larger than 3.2 mm except plaumanni |
| :---: | :---: |
| 19(18). | Spine 3 stout, projecting a distance about half as great as longitudinal axis of its basal width; longitudinal axis of spine 3 diagonal, strongly converging posteriorly; female frons strongly impressed at sides of granulate area (often bifoveate) $\qquad$ 20 |
| - | Spine 3 subcylindrical, about one and one-half to two times as long as wide; female frons not bifoveate; larger species $\qquad$ 21 |
| 20(19). | Male granular area on frons smaller, as wide as long, its dorsal margin arcuate; female frons on lateral thirds (lateral to granular area) narrowly impressed on crescent-shaped area, impression occupying less than half of area from raised granular area to margin of eye, concavities not extending above upper level of eye; Nayarit to Guatemala; 1.5-2.1 mm $\qquad$ 18. difodinus Bright |
| - | Male granular area wider than long, its dorsal margin straight to feebly recurved; female frons has median third with contour equal to a regularly convex frons, lateral thirds strongly concave to above upper level of eyes; Costa Rica to Brazil; 2.0-2.4 mm . $\qquad$ 19. senex Schedl |

$21(19)$. Frons with definite, raised, granulate area; anterior margin of pronotum rather narrowly rounded, coarsely serrate; Costa Rica to Panama; 2.7-3.1 mm
20. peltatus Wood

- Frons aciculate, granulate area obsolete; anterior margin of pronotum more broadly rounded, serrations almost obsolete; Puebla: 2.2-2.5 mm

21. aciculatus Wood

22(18). Smaller; body slender, 3.5 times as long as wide; frons aciculate; granulate area absent; base of pronotal dise without transverse lines or asperities; Costa Rica and Panama to Brazil; 1.9-2.0 mm
22. plaumanni Schedl

- Larger; body stouter, less than 2.8 times as long as wide; frons with definite granulate area; base of pronotal dise with impressed, transverse lines23

23(22). Declivital spine 2 spaced by about equal distances from spines 1 and 3; bicolored; Costa Rica; 3.1-3.4 mm
23. bicolor Wood

- Declivital spine 2 arising very close to spine 1 , remote from spine 3; color black; Puebla; 3.6-3.9 mm

24. amplus Wood

## 1. Tricolus simplicis Wood

Tricolus simplicis Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):57 (Holotype, female; Palín, Esquintla, Guatemala; Wood Coll.)
Diagnosis.- In this species the frons is rather coarsely aciculate except for a small, median, raised, central granular area, and declivital spines 2 and 3 are essentially absent.

Female.- Length $1.8 \mathrm{~mm}, 2.8$ times as long as wide; color light brown.

Frons convex, shining, coarsely, convergently aciculate except on small, median, subcircular, raised granular area at center; vestiture inconspicuous. Antennal club broadly obovate; sutures 1 and 2 distinctly procurved, obtusely subangulate, finely septate
except at middle, without long setae on posterior face.

Pronotum 1.3 times as long as wide; sides straight and subparallel on basal half, narrowly rounded in front; summit indefinite, anterior to middle; anterior slope finely, closely asperate; anterior margin a rather strongly, acutely elevated continuous costa; posterior area reticulate, punctures obscure, very shallow, moderately close. Glabrous.

Elytra 1.7 times as long as wide, 1.4 times as long as pronotum; disc smooth, shining, punctures small, shallow, some obsolete, evidently at least slightly confused. Declivity occupying posterior third, excavated as in other members of this genus; face smooth,
shining, indistinct punctures small, confused; lateral margins rather strongly, continuously elevated on heart-shaped pattern from suture to moderately near posterior margin, gradually increasing in height posteriorly, ending precipitously on lower, median angle; spine 1 on interstriae 1 at base very small, pointed, 2 feebly indicated, 3 rounded, not projecting. Glabrous.

Distribution.- Guatemala to Costa Rica.
Guatemala: Palín, Esquintla, 19-V-64, 300 m . No. 685, Ficus, S. L. Wood. COSTA RICA: Volcán, Puntarenas. 11-XIL-6.3, 1000 m , No. 304, tree branch, S. L. Wood.

Biology.- Specimens were taken from twigs 1 cm in diameter.

Notes. - The above treatment was based on the holotype and on one other specimen.

## 2. Tricolus inornatus Wood

Fig. 21.3
Tricolus inornatus Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):57 (Holotype, female; 15 km SE Cartago, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from simplicis Wood by the much more

h

Fig. 213. Tricolus spp., dorsal and lateral aspects of declivity: a. inornatus; b, ardis; c, parsus; d, badius; e, nodifer: f, partilis; 〔, capitalis; h. saundersi.
slender body, by the narrower declivital excavation, and by the absence of declivital spine 1 .

Female.- Length $1.8 \mathrm{~mm}, 3.2$ times as long as wide; color very dark brown.

Frons evidently as in simplicis, upper half concealed. Antennal club subcircular, sutures almost straight; posterior face with two or three long hairs.

Pronotum 1.4 times as long as wide; essentially as in simplicis except punctures on posterior area deeper, distinct, a slight irregularity at base anterior to scutellum. Glabrous.

Elytra 2.0 times as long as wide; dise as in simplicis. Declivity similar to simplicis except excavated area much narrower, spine 1 represented only by a small callus, 2 represented by a distinct callus, 3 more broadly rounded, not projecting. Glabrous.

Distribution.- Costa Rica.
COSTA RICA: 15 km SE Cartago, Cartago, 24-IX-6i3. 2800 m , No. 248, Siparuna nicaraguacnsis, S. L. Wood.

Biology.- One specimen was taken from a small, broken branch.

Notes. - The above treatment was based on the holotype.

## 3. Tricolus inaffectus Wood

Tricolus inaffectus Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):57 (Holotype, female; Volcán Poás, Heredia, Costa Rica: Wood Coll.)
Diagnosis.- This species is distinguished from inomatus Wood by the larger, stouter body, by the impressed lower, lateral areas of the frons, by the pronotum, and by the slightly wider elytral declivity.

Female.- Length $2.6 \mathrm{~mm}, 2.9$ times as long as wide; color black except elytral disc and antennae yellowish brown.

Frons as in simplicis Wood except granular area more strongly elevated; lateral area impressed just above epistoma; mandibles apparently elongate. Antennal club broadly oval, sutures straight; posterior face ornamented by more than 20 long hairs.

Pronotum 1.2 times as long as wide; outline about as in simplicis except sides on slightly more than anterior half distinctly constricted, anterior costa more nearly serrate; posterior areas reticulate, punctures moderately fine, rather deep. Glabrous.

Elytra 1.8 times as long as wide, 1.6 times as long as pronotum; as in inornatus Wood
except excavated declivital area distinctly wider, calluses indicating positions of spines 1 and 2 less conspicuous. Glabrous.

Distribution.- Costa Rica.
COSTA RICA: Volcán Poás, Heredia, 19-XI-63, 2600 m , host not recorded, S. L. Wood.

Notes. - The above treatment was based on the holotype.

## 4. Tricolus cecropii Wood

Tricolus cecropii Wood, 197t. Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):58 (Holotype, female; Turrialla, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished by the moderately stout body, by the poorly developed declivital spines, by the strongly produced, acute, strongly serrate anterior margin of the pronotum, by the large, subreniform granular area on the frons, and by the habits.

Female.- Length $2.2-2.5 \mathrm{~mm}, 2.6$ times as long as wide; color dark brown.

Frons somewhat flattened on median three-fourths from epistoma to upper level of eyes, most of flattened area occupied by a raised, granular area of subreniform shape. Antennal club obscurely subtriangular, sutures weakly procurved; very few long setae on posterior face.

Pronotum 1.3 times as long as wide; widest near base, sides weakly converging on basal two-thirds; anterior margin very strongly, subacutely produced and coarsely, closely serrate, 14-16 serrations; summit indefinite, near middle; anterior slope armed by rather large, low asperities; posterior area reticulate, punctures sparse, fine, shallow. Glabrous.

Elytra 1.5 times as long as wide, 1.2 times as long as pronotum; disc smooth, punctures small, shallow, confused. Declivity moderately steep, excavation narrower and not as deep as in other species; spines 1 and 2 present as small, pointed tubercles, l slightly larger, 3 represented by a low, poorly developed fold; subapical margin subacute, not produced. Subglabrous.

Male.-Similar to female.
Distribution.- Costa Rica.
COSTA RICA: Turrialba, Cartago, 5 -VII-63, 700 m , No. 19, Cecropia peltata petioles, S. L. Wood.

Biology.- Specimens were taken from spiral-shaped galleries in the petioles of fallen Cecropia leaves. This species was
invariably found in the same tunnels with Corthylus cecropii Wood in an apparent domicile parasitic or mutualistic role. Adults of both species were usually present, but occupied different branches of the same gallery system. Few larvae were produced by either species.

Notes.- The above treatment was based on the type series of 10 specimens.

## 5. Tricolus ardis Wood

Fig. 213
Tricolus ardis Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):58 (Holotype, female; Escasú, San José, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished by the acutely angulate, strongly serrate anterior margin of the pronotum, by the aciculate frons which also has a small elevated granulate area, and by the elytral declivity.

Female.- Length 2.1-2.5 mm, 3.3 times as long as wide; head, prothorax, and elytral declivity dark brown, basal two-thirds of elytra light brown.

Frons convex, convergently aciculate except for a small, transversely oval granular area at center occupying median third. Antennal club broadly obovate, sutures moderately arcuate; posterior face without long hair.

Pronotum 1.5 times as long as wide; sides almost straight and parallel on basal half, arcuately converging to subacute median angle in front; anterior margin coarsely serrate; summit indefinite; anterior slope finely, closely asperate; posterior areas reticulate, punctures fine, shallow, not close, some of those at base connected by transverse lines. Glabrous.

Elytra (including spines) 2.1 times as long as wide; sides straight and parallel to base of declivity, arcuately converging to apex of spine 3, apices of spine 3 separated by a distance equal to width of elytra, posterior emargination broadly, somewhat U-shaped; surface almost smooth, shining, punctures shallow, small, largely confused, their centers apparently reticulate. Declivity moderately steep, excavated in a narrowly heart-shaped area; lateral areas abruptly, rather strongly elevated, spine 1 at base on interstriae 1 rather small, sharply pointed, 2 one-third declivital length from base, twice as long as
wide, 3 projecting posteriorly, conspicuously longer than wide (as seen in lateral aspect). Glabrous except for an occasional hairlike seta near declivity.

Male.- Similar to female except for apical terga of abdomen.

Distribution.- Costa Rica and Panama.
COSTA RICA: Escasú, San José, 2-X-6.3, 1300 m , No. 218, tree seedling, S. L. Wood. PANAMA: Cerro Punta, Chiriquí, 11-1-64, 1800 m , Nos. 380, 401, tree branches, S. L. Wood.

Biology.-Specimens were taken in stems $2-4 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 26 specimens.

## 6. Tricolus parsus Wood <br> Fig. 213

Tricolus parsus Wood. 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):59 (Holotype, male?; 15 km SE Cartago, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from inaffectus Wood by the more narrowly rounded anterior margin of the pronotum, by the acutely elevated, subapical margin of the declivity, and by the very different declivital spine 3.

Male(?).-Length $2.3 \mathrm{~mm}, 2.6$ times as long as wide; color almost black.

Frons of type largely concealed, evidently not aciculate, finely granulate, raised granular area as in ardis Wood. Antennal club broadly subquadrate, sutures feebly procurved.

Pronotum 1.3 times as long as wide; about as in ardis except anterior margin narrowly rounded, not angulate, serrations with their bases contiguous. Glabrous.

Elytra 1.6 times as long as wide, 1.3 times as long as pronotum; sides straight and parallel on basal two-thirds, gradually narrowed, rather broadly rounded behind, with a conspicuous, rather narrow emargination at suture; surface almost smooth, shining, punctures largely confused, small, moderately deep. Declivity much as in inaffectus except slightly wider, margins slightly higher, spine more strongly developed but not pointed, spine 3 more distinctly converging mesad, its crest not as high, its apex rounded, distinctly, weakly projecting; subapical margin acutely elevated, projecting moderately to produce sides of median emargination. Glabrous except for an occasional hairlike seta on sides.

Distribution.- Costa Rica.
COSTA RICA: 15 km SE Cartago, Cartago, 24-1X-63, 1800 m , No. 196, woody vine (liana), S. L. Wood.
Biology.- One specimen was taken from a vine 5 mm in diameter.

Notes.- The above treatment was based on the holotype.

## 7. Tricolus rufithorax Wood

Tricolus rufithorax Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):59 (Holotype, female; Finca Gromaco on Río Coto Brus, Puntarenas, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from parsus Wood by the larger size, by the well-developed declivital spines, by the subserrate anterior margin of the pronotum, and by other characters.

Female.- Length 2.7 mm (male 3.1 mm ), 2.4 times as long as wide; color reddish brown except elytra black.

Frons convex, reticulate-granulate above, somewhat punctate laterally; subcircular raised, granular area occupying slightly more than median third to upper level of eyes; glabrous except on epistoma. Antennal club moderately large, almost subtriangular, sutures weakly procurved; posterior face bearing two long hairs.

Pronotum 1.2 times as long as wide; outline as in parsus except anterior margin less narrowly rounded, its elevated costa weakly serrate; posterior areas strongly reticulate, very low, strongly transverse, asperities continuing from summit to base. Glabrous.

Elytra 1.4 times as long as wide, 1.2 times as long as pronotum; outline about as in parsus except sutural emargination smaller and spine 3 projecting very slightly; dise smooth, shining, punctures fine, confused. Declivity with contours much as in parsus except spine 1 conical, slightly larger, 2 cylindrical, projecting slightly more than its basal width, 3 low, costate, ending abruptly, not projecting, directed toward sutural apex but ending remote from it, subapical margin acutely elevated but less strongly than in parsus. Glabrous except for a few setae on sides.

Male-Similar to female except without long hair on posterior face of antennal club; declivital spine 2 of allotype abnormal, apparently chewed off on both sides.

Distribution.- Costa Rica.

COSTA RICA: Finca Gromaco on Río Coto Brus, Puntarenas, 14-V11-63, 500 mn, No. 65, woody vine, S. L. Wood.

Biology.- Two specimens were taken from one tunnel in a woody vine less than 1 cm in diameter.

Notes.- The above treatment was based on the holotype and allotype.

## 8. Tricolus badius Wood Fig. 213

Tricolus badius Wood. 1974. Brigham Young Univ. Sci. Bull.. Biol. Ser. 19(1):60) (Holotype, female; Pandora, Limón, Costa Rica: Wood Coll.)
Dagnosis.- This species is distinguished from nodifer Blandford by the smaller size, by the reddish brown color, and by the more widely spaced third spines which are very close to the subapical margin.

Female.- Length 2.3-2.8 mm, 2.6 times as long as wide; color reddish brown.

Frons as in rufithorax Wood except raised granular area occupying one-fourth space between eyes. Antennal club subcircular, sutures rather weakly procurved; posterior face with up to a dozen long, hairlike setae.

Pronotum 1.2 times as long as wide; as in rufithorax.

Elytra 1.5 times as long as wide; outline as in rufithorax except spine 3 projecting more strongly; disc smooth, shining, with very fine, irregular lines, punctures fine, shallow, confused. Declivity as in rufithorax except spine 2 more slender, twice as long as wide; 3 close to costal margin, separated by about half its basal width, subapical margin reaching its posterior margin; spine 3 projecting, subtriangular, almost as high as its basal width; subapical margin acutely, not strongly elevated. Subglabrous.

Male--Similar to female except antennal club with fewer long setae.

Distribution.- Costa Rica and Panama.
COSTA RICA: Pandora, Limón, 13-V111-63, 50 m , No. 150, tree branch, S. L. Wood; Peralta, Cartago, 10-111$64,500 \mathrm{~m}$. No. 462 , woody vine, S. L. Wood. PANAMA: Cerro Punta near Volcán Chiriquí, 11-1-64, 1800 m , No. 376, tree branch, S. L. Wood; Ft. Clayton. Canal Zone, 22-XII-63, No. 332, tree limb, No. 329. Seriania, S. L. Wood.

Biology.- Specimens were taken from stems $1-4 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 33 specimens.

## 9. Tricolus nodifer Blandford

 Figs. 213, 215Tricolus modifer Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):287 (Holotype, sex?; Mirandilla, Esquintla, Guatemala; British Mus. Nat. Hist.)
Tricolus triarmatus Schedl, 1939, Mitt. Münchner Ent. Ges. 29:578 (Holotype, sex?; Colonia, presumably in Mexico; Schedl Coll.); Wood, 1966. Great Ba$\sin$ Nat. 26:30. Synonymy
Diagnosis.- This species is distinguished from badius Wood by the larger size, by the black color, and by declivital characters.

Female.- Length $2.7-3.0 \mathrm{~mm}, 2.5$ times as long as wide; color almost black.

Frons essentially as in badius; antennal club subtriangular, sutures moderately procurved, posterior face with several long, hairlike setae.

Pronotum 1.2 times as long as wide; as in badius except one median serration on anterior margin usually more strongly developed; anterior half of discal area largely devoid of transverse crenulations.

Elytra 1.5 times as long as wide, 1.2 times as long as pronotum; about as in badius except lower area more broadly flattened, submarginal costa passing laterad of spine 3 , spine 3 not as close to costal margin and stouter, length usually conspicuously shorter than basal width.

Male.- Similar to female except long hair on posterior face of antennal club reduced or absent.

Distribution.- Guatemala to Costa Rica, possibly Veracruz.

MEXICO: "Colonia," type locality of triarmatus may have been in Veracruz. GUATEMALA: Mirandilla, Esquintla, G. C. Champion. COSTA RICA: Turrialba, Cartago, 5-VII-63, 700 m, No. 19. Cecropia petiole; Finca Gromaco, Puntarenas, 14-VII-63, 500 m , No. 59, tree branch, S. L. Wood; Volcán, Puntarenas, 11-XII-63. 1000 m, No. 304, S. L. Wood.

Biology.- Specimens were taken from stems $2-5 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on 11 specimens, 2 of which were compared directly to the holotypes of nodifer and triarmatus by me. The origin of the type of triarmatus is uncertain; localities designated "Colonia" occur throughout Latin America.

## 10. Tricolus partilis Wood Fig. 213

Tricolus partilis Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):60 (Holotype, male; Volcán, Puntarenas, Costa Rica; Wood Coll.)

Diagnosis.- This species is distinguished from nodifer Blandford by the smaller size, by the brown color, by the more slender body form, by the more slender spine 3 on the elytral declivity, and by other characters.

Female.- Length $1.7-1.8 \mathrm{~mm}, 2.8$ times as long as wide; color brown.

Frons as in nodifer except granular area distinctly elevated; antennal club subcircular.

Pronotum 1.3 times as long as wide; as in nodifer except transverse crenulations in discal area reduced to a few transverse lines.

Elytra 1.7 times as long as wide, 1.3 times as long as pronotum; essentially as in nodifer except spines 1,2 , and 3 more slender, 3 distinctly longer; lower declivity less broadly flattened; subapical margin more strongly elevated.

Male.-Similar to female except with fewer long setae on posterior face of antennal club.

Distribution.- Costa Rica.
COSTA RICA: Finca Gromaco on Río Coto Brus, Puntarenas, 14-V11-63, 500 m , No. 59 , tree branch, S. L. Wood: Volcán, Puntarenas, 11-XII-63, 1000 m , No. 304, tree branch, S. L. Wood.

Bıology.- Specimens were taken from branches about 4 cm in diameter.

Notes.- The above treatment was based on the type series of four specimens.

## 11. Tricolus fenoris Wood

Tricolus fenoris Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):60 (Holotype, male?: 15 km SE Cartago. Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from partilis Wood by the larger size, by the more slender body form, and by the longer, more slender declivital spines.

Male.- Length $2.1 \mathrm{~mm}, 3.0$ times as long as wide; color very dark brown.

Frons, antenna, and pronotum as in partilis; pronotum 1.3 times as long as wide.

Elytra 1.7 times as long as wide, 1.3 times as long as pronotum; as in partilis except spine 2 three times as long as its basal width, spine 3 about one and one-half times as long as its basal width; subapical margin more strongly produced.

Distribution.- Costa Rica.
COSTA RICA: 15 km SE Cartago, Cartago, 24-IX-63, 1800 m , No. 196, woody vine, S. L. Wood.
Biology.- One specimen was just entering a stem 5 mm in diameter.

Notes.- The above treatment was based on the holotype.

## 12. Tricolus frontalis Wood

Tricolus frontalis Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):61 (Holotype, female; 8 km or 5 mi NE Teziutlán, Puebla, Mexico: Wood Coll.)
Diagnosis.- This species is distinguished by the aciculate frons with the granular area absent, and by the slender declivital spine 3 .

Female. - Length $2.4 \mathrm{~mm}, 3.1$ times as long as wide; color dark brown.

Frons convex, aciculate, granulate area absent.

Pronotum 1.3 times as long as wide; as in fenoris Wood except anterior margin more broadly rounded.

Elytra 1.9 times as long as wide, 1.5 times as long as pronotum; about as in fenoris except declivital spine 3 longer, almost three times as long as wide; spine 3 similar in shape to 2 but larger, about two and one-half times as long as wide; subapical margin rather poorly elevated.

Distribution.- Puebla.
MEXICO: Puebla: 8 km NE Teziutlan, 27-vi-53. 1600 , tree branch. S. L. Wood.

Notes.- The above treatment was based on the holotype.

## 13. Tricolus capitalis Wood

 Fig. 213Tricolus capitalis Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):61 (Holotype, female: 13 km SE El Hato del Volcán, Chiriquí, Panama: Wood Coll.)
Diagnosis.- This species is distinguished from ruficollis (Fabricius) by the slightly smaller size, and by the much less strongly elevated subapical margin of the elytral declivity (thereby eliminating the sutural notch).

Female.- Length $2.1 \mathrm{~mm}, 2.7$ times as long as wide; color rather dark reddish brown.

Frons convex, finely rugose-reticulate, granular area distinctly elevated, subcircular, occupying median third to upper level of eyes; glabrous. Antennal club rather broadly obovate, sutures moderately procurved.

Pronotum 1.3 times as long as wide; sides straight and parallel on basal half, rather narrowly rounded in front; anterior margin armed by about eight coarse teeth (bases of some contiguous); summit indefinite, about one-third pronotum length from anterior margin; anterior slope rather coarsely, closely asperate; posterior areas reticulate, punctures fine, those near base with transverse line or minute shining elevation on their margins. Glabrous.

Elytra 1.6 times as long as wide, 1.2 times as long as pronotum; dise smooth, shining, punctures rather fine, shallow, confused. Declivity excavated basically as in other members of genus; spine 3 stout, subtriangular, projecting slightly, as in ruficollis, separated from subapical margin by width of spine; lower declivity flattened below spine 3 to lateral margin of spine 3, subapical margin almost straight, rather weakly elevated, without sutural emargination, not at all produced as in ruficollis.

Distribution.- Panama.
PANAMA: 13 km S El Hato del Volcán, Chiriquí, 7-1$64,1000 \mathrm{~m}$, No. 371 , tree seedling, S. L. Wood.

Biology. - Specimens were taken from a stem 2 cm in diameter.

Notes.- The above treatment was based on the type series of two female specimens.

## 14. Tricolus saundersi Wood <br> Fig. 213

Tricolus saundersi Wood, 1967, Great Basin Nat. 27:139 (Holotype, male; Dominical, Puntarenas, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from capitalis Wood by the slightly larger size, by the granular area on the frons being much wider than long, and by the more slender, subquadrate declivital spine 3.

Female.- Length 2.3-2.6 mm, 2.8 times as long as wide; color reddish brown.

Frons broadly convex, surface rather finely reticulate and finely punctured, with a large, transversely oval, slightly elevated, coarsely reticulate area occupying central half, its upper limits slightly above upper level of eyes; vestiture limited to epistomal margin. Antennal club broadly obovate, suture 1 weakly, 2 moderately procurved, both sutures partly septate.

Pronotum 1.4 times as long as wide; widest near base, sides almost straight, almost imperceptibly converging anteriorly on basal half, then very narrowly, almost subangulately rounded in front; anterior margin armed by a series of about a dozen teeth, median one larger and projecting more nearly forward; asperities decreasing in height posteriorly, those a short distance behind summit appearing as shining wrinkles; posterior areas reticulate, very finely, sparsely punctured. Glabrous.

Elytra 1.5 times as long as wide, 1.6 times as long as pronotum; sides almost straight and subparallel to base of declivity then arcuately narrowed about a fourth to projecting declivital spine 3, very broadly, shallowly emarginate behind; surface almost smooth, shining, punctures rather fine, not close, strial and interstrial punctures not close, in obscure rows except confused near suture. Declivity abrupt, broadly excavated, lateral and upper margins abruptly elevated; upper margin bearing a small, acute tooth as tall as wide, in line with striae 1 , spine 2 on lateral elevation just above middle of declivity, subquadrate, about one and one-half times as long as basal thickness, projecting caudad and slightly dorsad; spines 1 and 2 connected by an acutely margined ridge thicker than high, 3 just above and basally separated from the acutely marked posterior declivital margin, subquadrate, with upper basal margin expanded, twice as thick and almost twice as long as 2, directed primarily caudad but slightly mesad and dorsad; ridge connecting 2 and 3 thicker than above, but with same continuous acute inner margin that ends in 3; excavation broadly, transversely concave, suture slightly elevated, punctures rather fine, shallow, not sharply defined, confused. Glabrous.

Male.-Similar to female except posterior face of antennal club without long hair.

Distribution.- Costa Rica.
COSTA RICA: Beverley, Limón, 26-VIII-63, 7 m . No. 154, woody vine, S. L. Wood; Dominical, Puntarenas, 29-1X-64, 10 m , Thcobroma cacao, S. L. Wood.

Notes. - The above treatment was based on the type series of six specimens.

## 15. Tricolus naevus Wood

Fig. 214
Tricolas nacvus Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):61 (Holotype, female; Tapantí, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from ovicollis Blandford by the slightly larger size, by the very broad, subreniform granular area on the frons, by the narrowly flattened area below declivital spine 3 , and by the much stouter declivital spine 3.

Female.- Length 2.9-3.3 mm, 2.7 times as long as wide; color almost black.

Frons broadly convex, with lateral areas just above epistoma conspicuously impressed; sculpture of lower area irregular, smooth, and shining laterally, becoming subreticulate above; granular area very broad, occupying median two-thirds of area between eyes, at least three times longer than wide, its lower margin almost straight, strongly emarginate on its upper margin. Antennal club subtriangular but narrower than in ovicollis.

Pronotum 1.3 times as long as wide; as in ovicollis except anterior margin more narrowly rounded and more coarsely serrate.

Elytra 1.6 times as long as wide, 1.2 times as long as pronotum; as in ovicollis except declivital area below spine 3 flattened only to median margin of spine 3 ; spine 3 stout, subtriangular, its length about equal to its basal width. Subglabrous.

Distribution.- Costa Rica.
COSTA RICA: Tapantí, Cartago, 24-X-63, 1300 m , No. 241 in Phoebe mexicana, No. 244 in a woody vine, $S$. L. Wood.

Biology.- Specimens were taken from stems $2-5 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of five specimens.

## 16. Tricolus ovicollis Blandford

Figs. 214-215
Tricolus oricollis Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):287 (Holotype, sex?; Cerro Zunil, Quezaltenango, Guatemala; British Mus. Nat. Hist.)
Diagnosis.- Distinguishing characters are treated in the above key and in the diagnosis of naevus Wood.

Female.- Length 2.9-3.3 mm, 2.7 times as long as wide; color black except recently emerged specimens with basal half of elytra reddish brown.

Frons as in naevus except granular area transversely oval, slightly less than twice as wide as long. Antennal club wider than long; a few long setae on posterior face.

Pronotum 1.2 times as long as wide; sides straight and parallel on basal half, abruptly converging to rather narrowly rounded anterior margin; anterior margin subserrate; summit indefinite, about one-third pronotum length from anterior margin; posterior areas reticulate, punctures minute, some punctures in basal area of disc associated with feeble, transverse crenulations. Glabrous.

Elytra 1.5 times as long as wide, 1.3 times as long as pronotum; sides straight and parallel on basal half, slightly tapered to level of sutural apex, abruptly, broadly rounded behind, conspicuously emarginate at suture,
spine 3 projecting; declivity excavated and armed as in most other Tricolus except spine 3 almost twice as long as its basal width, declivital area below spine 3 flattened to lateral margin of spine 3, lateral margin rather strongly elevated, slightly bent dorsad, deeply, rather broadly emarginate at suture. Subglabrous.

Male.-Similar to female except antennal club subcircular, with fewer long setae on posterior face; granular area on frons sometimes wider but upper margin always straight.
Distribution.- Puebla to Costa Rica.
MEXICO: Puebla: 9 km NE Teziutlán, 27-VI-53, and 2-VII-67, 1600 m, Miconia, S. L. Wood. GUATEMALA: Cerro Zunil, Quezaltenango, G. C. Champion. COSTA RICA: Tapantí. Cartago, $24-\mathrm{X}-63,1300 \mathrm{~m}$, No. 265 , Phoebe mexicana, 17-IX-63, No. 178, a woody vine, S. L. Wood.

Fig. 214. Tricolus spp., dorsal and lateral aspects of declivity: a, naevus; b, ocicollis; c, scitulus; d, difodinus; e, senex; f, plaumanni.

Biology.- Specimens were taken from cut branches $2-5 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on 22 specimens, one of which was compared directly to the holotype.

## 17. Tricolus scitulus Wood

Fig. 214
Tricolus scitulus Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(I):62 (Holotype, female; Tapantí, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from ovicollis Blandford by the smaller size, by the uniform brown color, and by the flatter lower declivity below spine 3 .

Female.- Length 1.9-2.3 m, 2.6 times as long as wide; color dark brown, young adults uniformly brown.

Frons and pronotum as in ovicollis except anterior margin of pronotum more narrowly rounded. Antennal club not quite as broad.
Elytra as in ovicollis except area below spine 3 flatter.

Male.- Similar to female except antennal club slightly smaller, with fewer long setae on posterior face.

Distribution.- Costa Rica, Panama, and Venezuela.

COSTA RICA: Tapantí, Cartago, 26-XI-63, 1300 m , No. 265, Phoebe mexicana, S. L. Wood: Turrialba, Cartago, 5-VII-63, 700 m , No. 23, Crotolaria, S. L. Wood. PANAMA: Cerro Punta near Volcán Chiriquí, 11-I-64, 1800 m , No. 406, tree branch, S. L. Wood. VENEZUELA: La Carbonera, 50 km NW Merida, Merida, 28 -IV-70, 2500 m , No. 453, woody vine, S. L. Wood.

Biology.- Specimens were taken from stems $1-3 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 13 specimens, and on 9 other specimens.

## 18. Tricolus difodinus Bright

Fig. 214
Tricolus difodinus Bright, 1972, Canadian Ent. 104:1380 (Holotype, male; 21 km or 13 miles N Ocozocoautla, Chiapas, Mexico; Canadian Nat. Coll., 12650)

Diagnosis. - This species is distinguished from bicavus Wood by the smaller average size, by the smaller, narrower excavations in the lateral areas of the female frons, and by the smaller, narrower granular area on the frons of both sexes.

Female.- Length 1.7-2.0 mm, 2.9 times as long as wide; color reddish brown.

Frons basically convex, with granular area in normal position, its lateral margins precipitous, lateral areas abruptly concave on a small oval or reniform area not extending above upper level of eyes, occupying less than half of area from granular area to margin of eye; surface shining, minutely irregular; glabrous except near epistoma. Antennal club moderately large, obscurely subtriangular, sutures obtusely subangular; posterior face with several long hairs on lateral and mesal margins.

Pronotum 1.3 times as long as wide; about as in ovicollis Blandford, anterior margin varying from moderately to very narrowly rounded.

Elytra 1.6 times as long as wide, 1.2 times as long as pronotum; elytra and upper declivity as in ovicollis. Declivity with spine 2 rather small, pointed; spine 3 low, broad, subrectangular; area below spine 3 not broadly flattened; subapical margin weakly elevated, not projecting, becoming obsolete well below base of spine 3 . Subglabrous.

Male.- Similar to female except frons evenly convex, elevated granular area subquadrate; antennal club subcircular, without long hair on posterior face.

Distribution.- Nayarit to Guatemala.
MEXICO: Chiapas: 21 km or 13 miles N Ocozocoautla, 2-VII-69, D. E. Bright; 8 km N Rosamorada, 15-Vll-65, 100 m , No. 252, tree branch, S. L. Wood. GUATEMALA: Palín, Esquintla, 19-V-64, 300 m , No. 591, Cola de Pavo branch. S. L. Wood.

Biology. - Specimens were taken from stems $2-4 \mathrm{~cm}$ in diameter.

Notes. - The above treatment was based on the holotype and on 12 other specimens.

## 19. Tricolus senex Schedl

Fig. 214
Tricolus senex Schedl, 1939, Mitt. Münchner Ent. Ges. 29:580 (Syntypes; Nova Teutonia, Brazil; Schedl and Plaumann colls.)
Diagnosis.- This species is distinguished from pernanulus Schedl by the larger average size, by the much more extensively impressed lateral areas of the female frons, and by the larger, broader granular area on the frons of both sexes.

Female.- Length $1.7-2.2 \mathrm{~mm}, 2.8$ times as long as wide; color reddish brown.

Identical with pernanulus and difodinus Bright except for frons. Frons with lateral thirds strongly, much more extensively impressed from precipitous mesal margin to inner margin of eye and from epistoma to well above upper level of eyes; upper margin of granular area on median third straight or weakly recurved. Sparse, short vestiture confined to epistomal area. Antennal club subtriangular, about intermediate between narrower difodinus and broader pernanulus.

Male. Similar to female except frons evenly convex, with similar granular area slightly elevated and wider than long; antennal club slightly smaller and more nearly oval, without long hair on posterior face.

Distribution.- Costa Rica to Brazil.
COSTA RICA: 15 km SE Cartago, Cartago, 24-1N-63. 1800 m , No. 203, Siporana nicaraguensis, S. L. Wood; Tapantí, Cartago, 17-V1II-63, 1300 m , No. 102, Calliandra coufusa, S. L. Wood: Beverley, Limón, 26-VIII63. 7 mm . No. 154, woody vine, S. L. Wood; Pandora, Limón, 23-VIII-63, 50 m , No. 149. tree branch, S. L. Wood; Volcán Puntarenas, 11-X11-63. 1000 m . No. 304 , tree branch, S. L. Wood. OTHER COUNTRIES: Brazil.

Biology. - Specimens were taken from stems 2-4 cm in diameter.

Notes.- The above treatment was based on the type series of 32 specimens.

The frontal characters used to distinguish difodinus, bicavus, and pernanulus are of a type that varies within series and between series in other genera. Nevertheless, in the limited material at hand they are completely consistent. It is entirely possible that specimens from intermediate areas would intergrade and make it necessary to recognize these forms as geographical races of one another.

## 20. Tricolus peltatus Wood

Tricolus peltatus Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):62 (Holotype, female; Cerro Punta near Volcán Chiriquí, Chiriquí, Panama; Wood Coll.)
Diagnosis.- This species is distinguished from the similar but remotely related nodifer Blandford by the subapical tubercle on declivital spine 3 , by the less strongly elevated subapical margin on the declivity, by the longer declivital spine 3 , and by other characters.

Female.- Length 2.7-3.1 mm, 3.0 times as long as wide; color very dark brown.

Frons, pronotum, and elytral disc as in nodifer, except granular area on frons slightly larger. Pronotum 1.3 times as long as wide.

Elytral declivity with basic contours as in nodifer, except spine 1 slightly larger, spine 2 more slender; spine 3 slightly longer than wide, more erect than in nodifer, with a conspicuous tubercle on dorsomedian subapical margin; subapical margin less strongly produced and less strongly elevated than in nodifer.

Male-Similar to female except posterior face of antennal club without long hair.

Distribution.- Costa Rica to Panama.
COSTA RICA: Voclán Poás, Heredia, 19-N1-63, 2500 m. No. 260, tree seedling. S. L. Wood. PANAMA: Cerro Punta near Volcán de Chiriquí, Chiriquí. 11-I-64, 1800 m. Nos. 372, 376, and 392 in tree branches, No. 385 in woody vine, S. L. Wood.

Biology. - Specimens were taken from stems 2-4 cm in diameter.

Notes.- The above treatment was based on the type series of seven specimens.

## 21. Tricolus aciculatus Wood

Tricolus aciculatus Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):62 (Holotype, female; 10 km or 6 miles NE Teziutlán, Puebla, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from peltatus Wood by the smaller size, by the more slender form, by the absence of a raised granular area on the frons, and by the presence of a very small granule in each puncture in the excavated area of the declivity.

Female.- Length 2.2-2.7 mm, 3.1 times as long as wide; color very dark brown.

Frons convex, rather weakly impressed above epistoma in lateral areas; surface shining, conspicuously aciculate on lateral thirds, obscurely on median third, granular area found in other species entirely absent; median area above epistoma with a broad, low, elevated area somewhat similar to allied species. Antennal club large, broadly, asymmetrically oval; sutures almost straight, obscure, indistinctly septate on central third; a very few long setae on posterior face.

Pronotum 1.3 times as long as wide; pronotum as in nodifer Blandford except anterior margin finely subserrate.

Elytra 1.7 times as long as wide, 1.4 times as long as pronotum; elytra as in peltatus except more slender, discal punctures slightly larger, punctures on declivital face each with a fine granule; declivital spines 2 and 3 more slender than in peltatus, 3 distinctly longer, bearing a subapical tubercle as in peltatus; subapical margin of declivity as in peltatus except from dorsal aspect median fifth appearing abruptly, shallowly emarginate. Subglabrous.

Male.-Similar to female except posterior face of antennal club without long hair.

Distribution.- Puebla.
MEXICO: Puebla: 10 km NE Teziutlán, 2-V1l-67, 1600 m, No. 137, Miconia, S. L. Wood.

Biology.- Specimens were taken from cut branches less than 4 cm in diameter.

Notes. - The above treatment was based on the type series of 48 specimens.

## 22. Tricolus plaumanni Schedl

Fig. 2I4
Tricolus plaumanni Schedl, 1954, Dusenia 5:40 (Syntypes: Rondon, Parana, Brazil; Schedl and Plaumann colls.)
Diagnosis.- This species is distinguished from aciculatus Wood by the much more slender antennal club, by the more distinctly compressed spine 3 , by the more strongly produced, much more narrowly emarginate subapical margin of the declivity, and by the lighter color.

Female. Length $1.9-2.0 \mathrm{~mm}, 3.4$ times as long as wide; color yellowish brown, pronotum and declivity a darker brown.

Frons as in aciculatus except more strongly aciculate. Antennal club similar to but much more slender than in aciculatus; posterior face without long hair.

Pronotum 1.5 times as long as wide; as in aciculatus except anterior margin feebly elevated, obscurely serrate, and discal punctures much less numerous, very shallow.

Elytra 2.0 times as long as wide, 1.4 times as long as pronotum; about as in aciculatus except spine 3 compressed, not as high as wide, subapical tubercle less conspicuous; subapical margin rather strongly elevated near suture, from dorsal aspect apices appearing subacute and separated by a narrow sutural emargination.

Male.-Similar to female.

Distribution.- Costa Rica and Panama to Brazil.

COSTA RICA: San Ignacio de Acosta, San José, 5-VII$63,1500 \mathrm{~m}$, No. 28, tree branch, S. L. Wood. PANAMA: Cerro Punta near Volcán de Chiriquí, 11-I-64, 1800 m , No. 385 in woody vine, No. 392 in tree branch, S. L. Wood. OTHER COUNTRIES: Venezuela, Brazil.

Biology.- Specimens were taken from stems $2-4 \mathrm{~cm}$ in diameter.

Notes. - Specimens from Panama were compared directly to Schedl's syntype of plaumanni. This syntype has declivital spine 3 slightly shorter and directed slightly more caudomesad than in most of the Panama specimens. Variation in my series, however, suggests they are the same species.

## 23. Tricolus bicolor Wood

Tricolus bicolor Wood, I974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):63 (Holotype, female: Volcán Poas, Heredia, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished by the color pattern, by the more dorsal position of the frontal granular area, and by the unique declivity.

Female.- Length 3.1-3.4 mm, 2.7 times as long as wide; color of dorsal surface yellowish brown except pronotal disc from summit to base and elytral declivity black, ventral surface black except legs light brown.

Frons of type series largely concealed, evidently convex above, shallowly impressed on lateral thirds of lower half, median area distinctly elevated above epistoma; granular area more dorsal in position than normal, largely above upper level of eyes, apparently wider than long. Antennal club slightly asymmetrical, sutures weakly procurved.

Pronotum 1.1 times as long as wide; sides feebly arcuate and subparallel on basal half, rather strongly converging anteriorly to rather narrowly rounded, serrate anterior margin; sculpture about as other Tricolus.

Elytra 1.7 times as long as wide, 1.5 times as long as pronotum; sides straight and parallel to level of sutural apex, truncate behind except for projecting spine 3 and small sutural emargination; disc and upper declivity about as in nodifer Blandford except declivital excavation more broadly impressed; spine 3 on extreme posterolateral margin, somewhat laterally compressed, appearing quadrate from lateral aspect, distinctly longer
than wide, with a conspicuous tubercle on dorsomedian apical angle, its mesal surface somewhat concave or grooved toward its apex; subapical margin acutely, weakly elevated, a shallow sutural emargination.

Distribution.- Costa Rica.
COSTA RICA: Volcán Poás, Heredia, 14-VII-63, 1500 m, No. 44, tree branch, S. L. Wood.

Biology.- Specimens were taken from a small branch.

Notes.- The above treatment was based on the type series of two specimens.

## 24. Tricolus amplus Wood

Tricolus amplus Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):63 (Holotype, female; 10 km or 6 miles. NE Teziutlan. Puebla, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished by the large size, by the black color, by the displaced declivital spine 2 , by the subtriangular granular area on the frons, and by other characters.

Female. - Length $3.6-3.9 \mathrm{~mm}, 2.5$ times as long as wide; color black.

Frons convex above, lateral areas above epistoma moderately impressed, lateral areas below upper level of eyes distinctly aciculate; median granular area largely above eyes, wider than long, subtriangular, its apex directed orad; vestiture of short, sparse hair. Antennal club slightly asymmetrical, obscurely subtriangular; sutures weakly procurved.

Pronotum 1.13 times as long as wide; about as in bicolor except basal area of dise more coarsely, more extensively asperate.

Elytra 1.4 times as long as wide, 1.3 times as long as pronotum; outline as in bicolor except posterior margin bisinuate; dise subshining, almost smooth, punctures very fine, shallow, confused. Declivity much as in allied species except lateral margin less abruptly, less strongly elevated; spine 1 in usual position at base on interstriae 1 ; spine 2 larger and stouter than usual and in position of interstriae 2 , its base beginning at level of apex of spine 1 (much more anterior in position than all other species); spine 3 strongly, laterally compressed, on lateral margin, quadrate, distinctly wider than long, a conspicuous tubercle on its dorsomesal apical angle; subapical margin acute, distinctly, not strongly
produced, extending to base of spine 3 . Subglabrous.
Male.- Similar to female, including long hair on posterior face of antennal club.

Distribution.- Puebla.
MEXICO: Puebla: 10 km NE Teziutlán, 2-VII-67. 1600 m , No. 140, tree limb, S. L. Wood.
Brology.-Specimens were taken from a limb $5-15 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of eight specimens.

## Genus AMPHICRANUS Erichson

Amphicranus Erichson, 18.36, Archiv Naturgesch. 2(1):633 (Type-species: Amphicranus thoracicus Erichson, monobasic)
Piczorhopalus Guerin-Meneville, 1838, Rev: Zool. 1838:107 (Type-species: Piczorhopalus nitidulus Guerin-Meneville =Amphicranus thoracicus Erichson, monobasic); Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):290. Synonymy
Steganocranus Eichhoff, 1878, preprint of Mém. Soc. Roy. Sci. Liége (2)8:460 (Type-species: Steganocranus dohrni Eichhoff, monobasic): Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):2S9. Synonymy
Diagnosis.- This genus is distinguished from Tricolus Blandford by the strongly to profoundly explanate and divaricate elytral apex, by the more variable, usually elaborately sculptured elytral declivity, by the more simple prothoracic precoxal area, and by other characters.

Description.-Length $\quad 2.5-8.0 \mathrm{~mm}$, 2.4-4.4 times as long as wide; color light brown to black, or bicolored.

Frons flat to convex, occasionally sexually dimorphic; eye oval, emarginate, antennal socket in emargination; antennal scape elongate, funicle 3 -segmented, less commonly 2 segmented, club broadly oval to elongate, sutures 1 and 2 each marked by fine line, occasionally also marked by setae; posterior face of female club often ornamented by long hair. Pronotum elongate, lateral margins usually with a fine raised line (three exceptions); sculpture of posterior areas very conservative, anterior areas sometimes highly modified. Elytral disc with fine punctures confused or in strial rows; posterior area variable, varying from almost truncate to elaborately excavated and ornamented by spines or carinae, posterior margin strongly to profoundly explanate, usually also divaricate at suture. Anterior face of contiguous
procoxal cavities transversely straight, not modified or noticeably pubescent. Protibiae not sexually dimorphic; as in Tricolus.

Distribution.- Jalisco and Veracruz to Bolivia and Brazil; about 46 species have been named, 29 of them occur in Mexico and Central America.

Biology.- These monogamous ambrosia beetles occur in branches, limbs, and boles of unthrifty, broken, or recently cut trees. Although most of them undoubtedly establish their own gallery system, apparently some of them appropriate the tunnel of another spe-
cies of Scolytidae or Platypodidae. The galleries are similar to those of Tricolus. Few young are produced in each gallery system. Most species are exceedingly rare and are found as individuals, as isolated mated pairs, or as the brood of one pair. They are largely restricted to the primary tropical forest.

Notes.- Tricolus probably is a wellmarked subdivision of this genus. Superficially, Amphicranus also appears to intergrade with Monarthrum, but characters on the female tibiae readily separate these genera.

## Key to the Species of Amphicranus

1. Anterior slope of pronotum declivous, asperate, margin rather narrowly rounded to emarginate, armed or not; female ventral area of head and mouthparts normal (subgenus Amphicranus)

- Anterior area of male pronotum feebly declivous, profoundly extended to form an acute median point; female pronotum devoid of asperities, anterior margin less strongly produced; female ventral area of head surrounding oral cavity excavated to accommodate greatly enlarged maxillae; elytral declivity excavated, strongly explanate and divaricate (subgenus Steganocranus)
2(1). Posterior margin of elytral declivity moderately explanate, not divaricate; basal fourth of pronotum (on disc) with fine, transverse rugae; declivity commencing on basal half of elytra, its margins armed by not more than two pairs of subspinose processes; anterior margin of pronotum unarmed; color black3
- Posterior margin of declivity moderately to profoundly explanate and divaricate; basal half of pronotum devoid of rugae; margins of declivity armed by two or more pairs of spines; anterior margin of pronotum armed or not4

3(2). Smaller; declivity steep, interstriae 1 armed by a small denticle at center of excavated area, posterolateral margin acutely costate from suture to above middle of lateral margin; black, legs yellowish; frons lacking a definite granulate area; Guatemala to Costa Rica; 3.5-4.0 mm ........ 1. brevipennis Blandford

- Larger; declivity gradual, suture 1 unarmed in excavated area, posterolateral margin acutely costate on lower third; black, abdomen reddish brown; lower frons with a narrow, elevated granulate area; Veracruz to Costa Rica; 6.3-7.5 mm

2. elegans Eichhoff

4(2). Lateral margins of pronotum with a fine raised line (except mirandus); posterior margin of declivity weakly to strongly explanate and divaricate, sutural notch rather narrowly $V$-shaped, anterior margin of pronotum variously sculptured

- Lateral margins of pronotum rounded, without a fine, raised line (except propugnatus and cordatus); posterior margin of declivity on median two-thirds not at all produced, posterolateral angles profoundly produced into forcepslike processes; pronotum narrowly rounded in front and coarsely serrate; base of male declivity with three small spines between suture and first major spine (two in propugnatus and cordatus)

| 5(4). | Lateral margin of declivity uniformly costate, without a tubercle or abrupt angle at level of sutural apex; base of declivity with a major spine on interstriae 2 $\qquad$ |
| :---: | :---: |
| - | Lateral margin of declivity with either a denticle or an abrupt angle at level of sutural apex . $\qquad$ 15 |
| $6(5)$. | Declivity with a moderately large, blunt spine on lower half of declivity on interstriae 1 just before sutural apex; posterolateral explanate process about as long as wide $\qquad$ $\qquad$ $\qquad$ |
| - | Interstriae 1 near apex of suture unarmed, posterolateral elytral processes each about twice as long as wide $\qquad$ |
| $7(6)$. | Larger; major spine at base of elytral declivity blunt; lateral margin of declivity more strongly elevated, apex of posterolateral processes more broadly rounded; Navarit to Guatemala; 3.0 mm .................................... 3. hybridus Blandford |
|  | Smaller; major spine at base of declivity sharply pointed; lateral margin of declivity less strongly elevated, apex of posterolateral process more narrowly rounded; Nayarit to Veracruz; 1.8 mm ................................... 4. stenodermus (Schedl) |
| $8(6)$. | Basal margin of declivity armed by one pair of tubercles or spines on interstriae 2 (often appearing as though on 1), males with a second spine on margin near middle of declivity, females with a tubercle at same level but strongly displaced mesad; frons never with a specialized granular area; posterolateral areas of declivity weakly to moderately elevated $\qquad$ 9 |
| - | Basal margins of elytra armed by two or three pairs of spines, male and female declivities similar; frons usually with a specialized median granular area; posterolateral margins of declivity very strongly extended ........................................ 13 |

9(8). Elytral declivity with rather coarse, close, confused punctures, female spine 2 represented by a minute granule closer to lateral margin than to suture at level of middle of declivity; female antennal club 1.5 times as long as wide, widest on basal half, posterior face without a tuft of hair; male unknown; Costa Rica; 2.2 mm

- Declivital area with punctures minute to obsolete, female spine 2 a pointed tubercle; female antennal club widest on apical half, posterior surface ornamented by a tuft of hair

10(9). Female declivity with lateral margin on middle third forming a large mammiform elevation; spine 2 at its apex directed caudomesad, basal margin with small granules on interstriae 1 and 2; antennal club widest at suture 2, apical margin rounded; Costa Rica; 4.0 mm

- Female declivity with spine 2 closer to suture than to lateral margin and not supported on an elevation connected to lateral margin

11(10). Smaller; declivity more gradual, male with spine 2 conical, as small as 1 , below middle of declivity, female with a rugose area extending from below spine 2 to lateral margin; female antennal club as long as scape, 1.1 times as long as wide, tuft of hair on posterior face much shorter than club; Costa Rica to Panama; $1.5-2.0 \mathrm{~mm}$

- Larger; declivity very steep, male with spine 2 large, subconical, projecting, at middle of declivity, female with declivital surface smooth, shining; female antennal club much longer than scape, tuft of hair longer than club

12(11). Smaller; lower margin of male epistomal process straight, occupying about half of epistomal width; female epistomal process unarmed; female antennal club slightly longer than wide ( 1.1 times); female declivity without a marginal granule near spine 2; Costa Rica; 2.8-3.0 mm

- Larger; lower margin of male epistomal process straight, occupying more than three-fourths of epistomal width; female epistomal process armed by a small, low, median tubercle; female antennal club much longer than wide ( 1.4 times), its apical margin arcuate; female declivity with a small tubercle on lateral margin near spine 2; Costa Rica to Panama; 4.1-4.6 mm

9. melanura (Blandford)

13(8). Basal margin of declivity armed by three pairs of spines; posterolateral processes on declivity laterally compressed, appearing subquadrate from lateral aspect, comparatively short; Durango; Quercus; 3.5-3.7 mm
10. rameus Wood

- Basal margin of declivity armed by two pairs of spines; posterolateral processes on declivity dorsoventrally compressed, very long; smaller, more slender species
14(13). Area between posterolateral elytral processes narrowest at sutural apex, widest two-thirds of its length from sutural apex, inner margin of process armed by a stout denticle at this widest point; anterior margin of male pronotum procurved and serrate; female frons entire; lateral margins of pronotum with a fine raised line; Panama to Venezuela; $2.6-2.8 \mathrm{~mm}$

11. terebella Blandford

- Area between male elytral processes broad at apex of suture, narrowest onethird length of process from suture, mesal margin of process obtusely angulate at this point; female processes much shorter, with a strongly elevated crest on median side of its dorsal surface; anterior margin of male pronotum broadly emarginate, unarmed, feebly procurved in female; female frons with a deep, median cleft or groove on lower third; lateral margin rounded, not marked by a fine, raised line; Costa Rica; males $2.8-3.5 \mathrm{~mm}$, females $2.5-2.8 \mathrm{~mm}$

12. mirandus Wood

15(5). Declivital base armed by only one pair of small denticles, lateral margins at level of sutural apex bluntly angled, not dentate, apical margin rather weakly to strongly explanate, notch $U$-shaped
Declivital base armed by at least two pairs of denticles, lateral margins at level
of sutural apex obtusely angled and armed by a small, acute denticle, apical
margin very strongly explanate, noteh V-shaped ..................................................... 19
16(15). Larger, more slender; anterior margin of pronotum rather weakly serrate (female only?); color pale or bicolored

- Smaller, less slender; anterior margin of pronotum coarsely serrate; color very dark brown

17(16). Larger; lateral and ventrolateral processes very strongly elevated; unicolorous; Costa Rica; 7.3 mm
13. ursus Schedl

- Smaller; lateral and ventrolateral processes on declivity rather modestly elevated; anterior half of pronotum and posterior half of elytra black, remaining areas yellowish brown; Costa Rica; 2.5-2.8 mm

14. tornatilis Wood

18(16). Angle on lateral margin of declivity at level of sutural apex less strongly produced, its anterior arm descending posteriorly; Costa Rica; 2.2 mm
15. speciosus (Schedl)

- Angle on lateral margin of declivity at level of sutural apex more strongly produced, its anterior arm horizontal or ascending slightly toward apex of angle; Costa Rica; 2.3-2.5 mm (see also 16b. spectus Wood)

16a. spectibilis (Wood)
19(15). Denticle on lateral margin of declivity at level of sutural apex quadrate, a strong emargination between its apex and posterior continuation of lateral margin; frons with a transversely elongate, raised, granulate area above upper level of eyes; yellowish or reddish brown except elytra and abdomen black; Costa Rica to Panama; 3.5-4.0 mm
17. collaris Blandford

- Denticle on lateral margin of declivity at level of sutural apex pointed, margin not at all emarginate on either side of denticle; granulate area on frons either absent or entirely below upper level of eyes; body entirely unicolorous or else part of pronotum black

20(19). Larger; frons with a raised, granulate area on lower half; antennal club larger,
almost twice as long as wide, widest on distal half .................................................. 21

- Smaller; frons without a raised, granulate area; antennal club only slightly longer than wide, widest on basal half22
$21(20)$. Anterior half of pronotum, posterior half of elytra, head, and abdomen black; posterior half of pronotum, anterior half of elytra, sternal area of thorax, and legs reddish brown; Nicaragua and Costa Rica; 6.3-7.0 mm (see also 19. torneutes Blandford, Guerrero, 5.8 mm )

18. belti Blandford

- Head, prothorax, and posterior third of elytra dark brown: basal two-thirds of elytra, sternal areas of meso- and metathorax, and abdomen yellowish brown; Guatemala; $7.5-8.0 \mathrm{~mm}$

20. balteatus Blandford
$22(20)$. Base of declivity lateral to major spine armed by a row of about five small denticles, lateral margin with spine at level of sutural apex rather large, displaced mesad and pointed mesad; declivital excavation with moderately abundant long hair

- Margin of declivity smooth between spines 1 and 2, spine 2 on margin, small; excavated area of declivity glabrous; smaller species

23(22). Smaller; basal area of pronotal disc without indications of asperities; elytra less strongly explanate, sutural emargination almost as wide as deep; Nayarit; 2.0 mm 23. parilis Wood

- Larger; basal area of pronotal disc minutely asperate; elytra more strongly explanate, sutural emargination half as wide as deep; Guerrero; 3.7 mm

24. filiformis Blandford

24(22). Lateral declivital process of elytra almost as long as wide, this process almost straight from denticle on its upper margin to its inner apical angle; Costa Rica; $1.8-1.9 \mathrm{~mm}$
21. macellus Wood

- Lateral declivital process of elytra almost twice as long as wide, this process arcuately narrowed from denticle on its upper margin to its inner apical angle; Venezuela and (?) Brazil; 3.4 mm

22. tenuis Blandford

25(4). Major declivital spine laterally compressed, quadrate, less than twice as long as wide; lateral margin of pronotum with fine, raised line; basal margins of declivity with two pairs of minor spines26

- Major declivital spine subcylindrical, more than three times as long as wide; lateral margins of pronotum rounded; declivity with only one major spine above ventrolateral process, basal margin with three pairs of minor spines

26(25). Margin of declivity smooth between first major spine and ventrolateral process, spine 1 cylindrical, blunt, ventrolateral process much shorter, stouter; granular area on frons occupying median third, heart-shaped; Oaxaca; 2.8 mm .
25. cordatus (Bright)

- Margin of declivity with a spine between first major spine and ventrolateral process, spine 1 quadrate, flattened, ventrolateral process rather slender; granular area on frons occupying median three-fourths; Guatemala; 3.8 mm

26. propugnatus Blandford

27(25). Smaller; pronotal disc with punctures almost to entirely obsolete; elytra subshining; Costa Rica; $2.0-2.4 \mathrm{~mm}$
27. spinescens Wood

- Larger; pronotal disc with small, shallow, moderately abundant punctures; elytra brightly shining; Costa Rica; $2.7-3.0 \mathrm{~mm}$............................ 28. spinosus Wood
28(1). Posterolateral process of male elytral declivity narrower, its upper margin horizontal, almost reaching declivital face at its middle then ascending rather abruptly to major spine on lateral margin; posterolateral elytral process in male with a moderately large, conical spine at level of apex of suture equidistant between mesal and lateral margins; female frons smooth and shining above level of eyes, a definite, sharply elevated, longitudinal oval granulate area extending from epistoma almost to upper level of eyes, this area about twice as long as wide; Panama; male $3.0-3.3 \mathrm{~mm}$, female 2.7 mm

29. mucronatus Wood

- Posterolateral process of male elytral declivity broad, ascending very slightly to meet major spine on lateral margin without approaching level of declivital surface; lateral margin of posterolateral elytral process in male with a small spine at level of apex of suture, sometimes displaced mesad but with its base reaching lateral margin; female frons finely rugose-reticulate to well above eyes, lower frons in median area slightly inflated and granulate, but without a definite elevated margin; Guatemala to Costa Rica; male 3.7-4.2 mm, female $2.7-3.2 \mathrm{~mm}$

30. fastigiatus Blandford
31. Amphicranus brevipennis Blandford Fig. 215

Amphicranus brexipennis Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):293 (Holotype, female'?: San Isidro. Suchitepéquez. Guatemala; British Mus. Nat. Hist.)
Diagnosis.- This is the only known Central American representative of this South American species group. It is distinguished from other Central American species by the strongly explanate but not divaricate subapical margin of the declivity, which continues without interruption to a large, rounded process on the basal third at about interstriae 3 , and by the presence of a small tubercle on interstriae 1 near the center of the declivity.

Male.- Length 3.5-4.0 mm, 2.4 times as long as wide; color black, legs yellowish brown.

Frons irregular, moderately arched transversely, almost straight longitudinally;
submarginal epistomal area moderately elevated on median third; surface finely, deeply rugose-reticulate; glabrous except for epistomal brush. Antennal funicle 2 -segmented; club large, elongate-oval, 2.0 times as long as wide.

Pronotum 1.1 times as long as wide; sides weakly arcuate and slightly converging anteriorly on basal three-fourths, broadly rounded in front; summit indefinite on anterior third; anterior fourth strongly declivous, rather finely, closely asperate; basal third with low, broad asperities decreasing in size from base; middle third with transverse, shining lines suggesting asperities but not elevated; surface finely rugose-reticulate, lateral areas with fine, obscure punctures. Glabrous.

Elytra 1.1 times as long as wide, 1.1 times as long as pronotum; sides straight, diverging slightly to declivity, broadly rounded behind; declivity commencing at middle; surface of

Fig. 215. Corthylini spp.: 1, Glochinocerus retusipennis, male, 2, 2a, 2b, same, female; 3. 3a, Tricolus ovicollis; 4, Tricolus nodifer; 5, 5a, 5b, Amphicranus elegans: 6, 6a, Amphicranus balteatus; 7, 7a, Amphicranus belti; 8, 8a, Amphicranus torneutes; 9, 9a, Amphicranus brecipennis; 10, 10a, Amphicranus collaris; 11, 11a, Amphicranus tcnuis; 12, 12a, Amphicranus filiformis; 13, 13a, Amphicranus tercbella: 14, 14a, 14b, Amphicranus fastigatus; 15, 15a, Amphicranus propugnatus; 16, 16a, Amphicranus hybridus. (After Blandford 1905:pl. 9.)
dise minutely irregular, punctures fine, shallow, obscure, confused. Declivity with upper margin abrupt from suture to a rounded prominence at interstriae 3 that continues margin and extends well behind declivital base, lateral margin of process continued as an acutely, strongly elevated margin to suture; suture narrowly divaricate; declivital face flattened below, rising to a distinct summit on interstriae 1 just above middle, this summit armed by a small, pointed tubercle; declivital face shining, densely, rather coarsely punctured. Glabrous.

Female.-Similar to male except basal margin less abrupt, more nearly rounded.

Distribution.- Guatemala to Costa Rica.
guatemala: San 1sidro, Suchitepéquez, G. C. Champion. COSTA RICA: Volcán, Puntarenas, 11-XII$63, \mathrm{I} 000 \mathrm{~m}$, No. 304, tree branch, S. L. Wood.

Brology.- Specimens were taken from a broken branch 7 cm in diameter.

Notes. - The above treatment was based on two males that were compared to the holotype. The basal margin of the declivity of the holotype was less abrupt and more nearly rounded. In an almost identical Venezuelan species this difference is a secondary sexual character. For this reason the holotype and the two Costa Rican males are regarded as different sexes of the same species.

## 2. Amphicranus elegans Eichhoff

 Fig. 215Amphicranus elegans Eichhoff, 1869, Berliner Ent. Zeitschr. 12:276 (Holotype, sex?: Mexico: presumably lost with Hamburg Mus.)
Diagnosis.- This species is distinguished from the remotely allied brevipennis Blandford by the larger size, by the more elongate form with much more gradual declivity, and by the different sculpture of the elytral declivity, pronotum, and frons.

Female.- Length 6.2-7.5 mm, 2.8 times as long as wide; color black except abdomen reddish brown.

Frons broadly convex; surface finely, densely granulate, punctures sparse, fine, obscure; raised median area occupying median one-seventh, 2.5 times as long as wide, extending from epistoma to above upper level of eyes, its surface densely, minutely punctured; raised epistoma transversely straight,
epistomal margin extended orad in lateral areas. Antennal funicle 3 -segmented, segments 2 and 3 almost fused; club large, 1.8 times as long as wide, slightly asymmetrical, suture 1 moderately, 2 more strongly angulate.

Pronotum 1.2 times as long as wide; sides feebly arcuate on basal half, subparallel, broadly rounded in front; anterior margin armed by one median serration; summit indefinite, on anterior third; anterior slope very steep, coarsely asperate; posterior two-thirds on median third transversely strigose, ridges shining, impressed lines reticulate, lateral areas smooth, shining, finely punctured. Glabrous.

Elytra 1.6 times as long as wide, 1.3 times as long as pronotum; sides almost straight and parallel to level of sutural apex, broadly rounded behind, narrowly, rather deeply divaricate; declivity commencing one-third elytral length from base, disc smooth, shining, punctures minute, confused. Declivity very gradual, extensively excavated; area of interstriae 1 and 2 moderately impressed from a point one-third elytral length from base to just in front of middle, then more abruptly impressed and margin continuing laterad then curving caudad to a major, rounded marginal process having its apex two-thirds elytral length from base, margin descending abruptly behind process and continuing to sutural apex; declivital face concave, shining, punctures fine, mostly obscure, a distinct callus in lateral areas of lower third. Glabrous, except moderately abundant, fine hair on apical fifth of declivity.

Male.- Similar to female except basal margin of declivity at interstriae 2 forming a blunt denticle.

Distribution.- Veracruz to Costa Rica.
MEX1CO: Veracruz: Cordoba, Eichhoff (not seen); Toxpam, Sallé. NICARAGUA: Chontales, Belt. COSTA RICA: Finca La Lola, Limón, VIII-64, Theobroma cacao, J. L. Saunders.

Notes. - The above treatment was based on six specimens, some of which evidently were compared by Blandford to the type before it was lost.
3. Amphicranus hybridus Blandford

Fig. 215
4. Amphicranus stenodermus (Schedl)

Pterocyclon sternodermus Schedl, 196:3. Ent. Arb. Mus.
Frey 14:166 (Holotype, sex?; Cordoba, presumably Veracruz, Mexico; Schedl Coll.)
Diagnosis.- This species is distinguished from hybridus Blandford, by the much smaller size, by the slightly less strongly elevated declivital margin, with the upper major spine pointed, and by the slightly shorter, more pointed ventrolateral processes of the declivity.

Female.- Length 1.9 mm , about 3.8 times as long as wide; yellowish brown, except anterior fourth of pronotum and elytral declivity rather dark brown.

As in hybridus except as noted in the diagnosis.

Distribution.- Nayarit and Veracruz.
MEXICO: Nayarit: 6 km W Tepic, 13-VII-65, 1000 m , No. 240, tree limb, S. L. Wood. Veracruz: Cordoba.

Biology. - One female was taken from a recently cut limb 8 cm in diameter.

Notes.- The above treatment was based on my female that was compared directly to the holotype. In the original description Schedl refers to a small denticle at interstriae 5 on the declivital margin. This denticle on my specimen, and the irregularities below it, evidently are much reduced. They also are so small on the type that I failed to call attention to them in my notes that describe it.

## 5. Amphicranus argutus Wood

Amphicranus argutus Wood, 1976, Great Basin Nat. 36:349 (Holotype, female; Finca La Lola, Limón, Costa Rica; Wood Coll.)
Diagnosis.- This species is remotely allied to melanura (Blandford) but is distinguished by the much smaller size and by the very different female frons and elytral declivity as described below.

Female.- Length $2.2 \mathrm{~mm}, 3.0$ times as long as wide; color dark reddish brown.

Frons convex above, a weak transverse impression between upper level of eyes and epistoma; epistoma weakly developed on median fourth; surface reticulate, punctures very small, shallow, not close; vestiture limited to epistomal margin. Antennal club 1.3 times as long as scape, 1.5 times as long as wide; tuft of hair on posterior face absent.

Pronotum 1.5 times as long as wide; sides straight on posterior two-thirds; indefinite summit on anterior fourth; anterior slope arising vertically from anterior margin to transverse costa, then gradually to summit, asperities broad, low, their anterior limit marked by a serrate costa near submarginal costa; posterior areas reticulate, fine, shallow punctures clearly marked. Glabrous.

Elytra 1.6 times as long as wide, 1.1 times as long as pronotum; sides straight and parallel on basal four-fifths, broadly rounded behind, feebly emarginate at suture; surface smooth, brightly shining, punctures very small and in strial rows on posterior third of dise, about twice as large and moderately confused on basal half; disc descending slightly on posterior third before declivital descent. Declivity subvertical, irregularly subconcave; posterolateral margin acutely, moderately elevated from suture to lateral margin slightly below middle of declivity, much more strongly elevated from this point to basal margin at suture; interstriae 1 at basal margin with a minute tubercle, a second tubercle at middle of declivity slightly closer to lateral margin than to suture; surface brightly shining, punctures moderately coarse, rather close, deep; excavated area wider than long. Glabrous.

Protibiae as in melanura.
Distribution- Costa Rica.
costa rica: Finca la Lola, Limón, VIII-63, No. 14, Theobroma cacao, J. L. Saunders.

Notes. - The above treatment was based on the holotype.

## 6. Amphicranus callosus (Schedl)

Pterocyclon callosum Schedl, 1935, Rev. de Ent. 5:351 (Holotype, female; Coronado, presumably San Isidro de Coronado, San José, Costa Rica; Schedl Coll.)
Diagnosis.- This species is distinguished from others in the melanura group of species by the unique epistoma and by characters of the female antennal club and female declivity as mentioned below.

Female. - Length $4.0 \mathrm{~mm}, 3.4$ times as long as wide; color dark reddish brown.

Frons as in melanura (Blandford) except epistoma; epistomal process low, very broad, its lower margin rather strongly impressed almost to margin of eye at level of ocular
emargination. Antennal club as in melanura except slightly stouter, tuft of hair smaller, much shorter.

Pronotum 1.4 times as long as wide; as in melanura.

Elytra 2.04 times as long as wide; sides straight and parallel on basal three-fourths, posterior margin broadly, rather deeply emarginate on median 40 percent; dise shining, strial punctures minute, in rows except confused near base, surface with weakly impressed, irregular lines, reticulate on basal half of interstriae 1. Declivity very strongly sulcate; basal margin abrupt, projecting slightly to striae 3 , margin armed by minute granules at interstriae 1 and 2 ; spine 2 supported on large mammiform elevation occupying middle half of declivity from lateral margin two-thirds distance to suture, spine 2 rather small, its apex directed caudomesad; posterolateral margin subacutely, rather strongly elevated, ending at junction with sutural emargination in a small tubercle; excavated area smooth, shining, punctures minute to obsolete. Glabrous except for a few hairs on lower margin of declivity.

Distribution.- Costa Rica.
COSTA RICA: Coronado (presumably San Isidro de Coronado, San José), 1400-1500 m, F. Nevermann.

Notes. - The above treatment was based on the holotype.

## 7. Amphicranus micans Wood

Amphicranus micans Wood, 1976, Great Basin Nat. 34:350 (Holotype, female; Río Damitas Dota Mts., San José, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from argutus Wood by the smaller size, by the smaller, broader antennal club, by the shorter pronotum, and by the different elytral declivity.

Female.- Length $1.5-2.0 \mathrm{~mm}, 3.0$ times as long as wide; color dark reddish brown, basal two-third of pronotum lighter.

Frons convex, epistomal process occupying median half, low, weakly developed; surface rugose-reticulate, punctures obscure; glabrous except at epistomal margin. Antennal club as long as scape, 1.1 times as long as wide, widest on apical third; tuft of hair on posterior face sparse, short.

Pronotum 1.4 times as long as wide; as in melanura (Blandford) except surface strongly reticulate, asperities more numerous, higher.

Elytra 1.8 times as long as wide, 1.3 times as long as pronotum; sides almost straight and parallel on basal three-fourths, very broadly rounded behind, feebly emarginate at suture; discal surface smooth, shining, except base of interstriae 1 reticulate in some specimens; strial punctures very small, in rows on posterior half, slightly confused on basal half. Declivity rather abrupt, very steep, somewhat biconcave; much as in argutus except acute posterolateral margin not as strongly elevated, ending before middle of declivity, tubercle on interstriae 1 slightly larger, closer to suture, tubercle 2 slightly below middle of declivity and much closer to suture (threefourths of distance from lateral margin to suture), a feeble to moderate elevation (variable) extending from lateral margin to tubercle; punctures almost obsolete, surface smooth, brightly shining except for oval rugose area below tubercle 2 extending from its base to lateral margin. Glabrous except for sparse setae on sides near declivity.

Male.- Similar to female except declivity rather deeply, broadly concave, lateral margins higher, tubercles distinctly larger, tubercle 2 on small submammiform elevation on mesal side of lateral margin, punctures on excavated area larger, deeper, rugose area absent.

Distribution.- Costa Rica to Panama.
COSTA RICA: Guapiles, Limón, 22-VIII-66, 100 m , Nos. 101, 109, 123, leguminous trees: Peralta, Cartago, 10-III-64, 500 m , No. 465, tree limb; Puerto Viejo, Heredia, 12-III-64, 70 m , No. 475, log; Río Damitas, Dota Mts., San José, 22-V11I-63, 250 m , No. 124, stmmp. PAN AMA: Ft. Clayton, Canal Zone, 22-XII-63, 30 m , No. 327, leguminous tree; Limón Bay, Canal Zone, 30-Xil$6: 3,3 \mathrm{~m}$, No. 352 , $\log$. All taken by me.

Biology. - Specimens were taken from material $10-20 \mathrm{~cm}$ in diameter.

Notes.-- The above treatment was based on the type series of 35 specimens.

## 8. Amphicranus fulgidus Wood

Amphicramus fulgidus Wood, 1976, Great Basin Nat 36:350 (Holotype, female; Finca Los Diamantes, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from melanura (Blandford) by the smaller size and by characters on the frons and elytral declivity.

Female.- Length 2.8-3.0 mm, 2.7 times as long as wide; color dark brown, basal twothirds of pronotum and elytra usually lighter.

Frons as in melanura except without any indication of a feeble carina or epistomal tubercle, but with a distinct, transverse impression above epistomal process and epistomal process broader. Antennal club 1.5 times as long as scape, 1.1 times as long as wide, apical margin straight; cirrus longer than club.

Pronotum 1.5 times as long as wide; as in melanura.

Elytra 1.5 times as long as wide, 1.15 times as long as pronotum; outline and disc as in melanura except posterior margin more broadly, more feebly emarginate. Declivity as in melamura except steeper, less strongly impressed, without a tubercle on lateral margin near middle of declivity.

Male.- Similar to female except antennal club oval, 1.3 times as long as wide, and declivity as in male melanura.

Distribution.- Costa Rica.
COSTA RICA: Finca Los Diamantes (near Dominical, Pentarenas) 7-II-63. Theobroma cacao, J. L. Saunders.

Notes.- The above treatment was based on the type series of 21 specimens.

## 9. Amphicramus melanura (Blandford)

Pterocyclon melanura Blandford, 1904, Biol. Centr. Amer.. Coleopt. 4(6):272 (Holotype, male; Volcán de Chiriquí, Chiriquí. Panama; British Mus. Nat. Hist.)
Pterocyclon opacifrons Schedl, I935, Rev. de Ent. 5:350 (Holotype female: Coronado, prestumably San Isidro de Coronado, San José, Costa Rica; Schedl Coll.); Wood, 1966, Great Basin Nat. 26:26. Synonymy
Dlagnosis.- This species is distinguished from fulgidus Wood by the larger size and by the characters of the head and declivity as indicated below.

Female.- Length 4.1-4.6 mm, 2.9 times as long as wide; color dark brown, basal twothirds of elytra lighter.

Frons convex, a feeble median (subcarinate) elevation slightly below upper level of eyes; outline of epistomal process obtusely angulate, its apex subtuberculate; surface strongly reticulate; setae confined to epistomal margin. Antennal club 1.5 times as long as scape, 1.4 times as long as wide, apical margin strongly arcuate; cirrus longer than club.

Pronotum 1.4 times as long as wide; sides almost straight and parallel on basal twothirds, rather broadly rounded in front; indefinite summit about one-fourth pronotum length from anterior margin; asperities very low, broad; posterior areas minutely reticulate, punctures minute, sparse. Glabrous.

Elytra 1.7 times as long as wide, 1.2 times as long as pronotum; sides almost straight and parallel to sutural apex, broadly rounded except rather shallowly, obtusely emarginate on median fourth; disc smooth, brightly shining; punctures very minute, almost obsolete, confused. Declivity very steep; posterolateral margin acutely margined, moderately elevated from sutural apex to level of middle of declivity, then moderately elevated and broadly rounded to striae 1 ; spine 1 at base, apparently on interstriae 2, small, conical; spine 2 similar, slightly below middle, slightly closer to suture than to lateral margin; area between spines 1 and 2 rather strongly concave, impressed area continued between lower spines and more broadly, less strongly concave; spine 2 on a low, submammiform elevation connecting to lateral margin; lateral margin with a small granule at middle of declivity. Glabrous except for a few setae on sides near declivity.

Male.-Similar to female except epistomal process higher, its margin almost straight, without a tubercle; frons not at all subcarinate; antennal club smaller, 1.6 times as long as wide; declivity broadly concave on heart-shaped outline, lateral margin subacute to base, much higher, spine 1 much larger, acute, spine 2 on margin, larger than 1 , subcylindrical, blunt.

Distribution.- Costa Rica to Panama.
COSTA RICA: Coronado (presumably San Isidro de Coronado, San José), 1400-1500 m, F. Nevermann; Tapantí, Cartago, 24-X-63, 1300 m , No. 265, Phoebe mexicana, No. 263, log, S. L. Wood. PaNAMA: Volcán de Chiriquí, Chiriquí, G. C. Champion.

Biology.- Specimens were taken from material $10-20 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on my three specimens that were compared directly to the holotypes of melanura and opacifrons.

## 10. Amphicranus rameus Wood

Fig. 217

Amphicranus rameus Wood, 1967, Great Basin Nat. 27:55 (Holotype, female; 5 km or 3 miles W El Salto, Durango, Mexico; Wood Coll.)
Diagnosis.- This unique species is distinguished by the shape of the granular area on the frons, by declivital sculpture, and by other characters.

Female. - Length 3.5-3.7 mm, 3.7 times as long as wide; color of pronotum in front of summit, elytral declivity and abdomen almost black, remainder of pronotum reddish brown, remainder of elytra yellowish brown.

Frons convex, its surface reticulate and rather coarsely, indistinctly punctured, median third with a low, sharply raised, flat, coarsely reticulate area resembling outline of a cup (more nearly heart-shaped in paratypes); vestiture inconspicuous. Antennal funicle two-segmented; club with two nonseptate, weakly arcuate sutures.

Pronotum 1.5 times as long as wide; sides straight and parallel on basal three-fifths, rather narrowly rounded in front; anterior margin projecting downward very slightly at center, armed by about 10 low teeth, median pair more prominently extended; summit three-fifths of pronotum length from base, indefinite, rather strongly declivous and coarsely asperate in front of summit, posterior area finely reticulate with small, shallow, rather sparse punctures; glabrous.

Elytra 2.2 times as long as wide; sides straight and parallel to a point even with sutural apex, posterolateral angles convergently projecting behind beyond broadly emarginate elytral apex; disc irregularly smooth, shining, subsurface punctures suggested but not attaining surface. Declivity abrupt, moderately steep, broadly excavated; margin subacutely elevated from interstriae 1 about two-thirds of distance from top of declivity, elevation not as high as wide, then continued on lower third to projecting subquadrate, converging, lateral processes, these processes about one and one-half times as long as their width in lateral profile; lateral margin armed by small, equal, pointed spines on interstriae 1 and 3 at base of declivity, and at interstriae 4 by a slender blunt tooth about twice as long as upper ones; lateral processes without special armature; median two-thirds of posterior
margin emarginate, emargination about half as deep as wide. Vestiture fine, scanty, confined to declivity.

Male.- Similar to female except raised frontal callus absent; a smaller tuft of hair present on antennal club.
Distribution.- Durango.
MEXICO: Durango: 5 km or 3 miles W El Salto, $7-$ VI-65, $2500 \mathrm{~m}, \mathrm{No} .41$, Quercus. S. L. Wood.

Biology.-Specimens were taken from a dying oak branch about 6 cm in diameter. The branch grew 8 m above the ground in a very large living tree.

Notes.- The above treatment was based on the type series of four specimens.

## 11. Amphicranus terebella Blandford Fig. 215

Amphicranus terebella Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):296 (Holotype, male?; Volcán de Chiriquí, Panama; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from hybridus Blandford by the serrate anterior margin of the pronotum and by the very different elytral declivity.

Male.- Length 2.6-2.8 mm, 4.5 times as long as wide; color light brown, anterior slope of pronotum and elytral declivity slightly darker.

Frons and pronotum as in hybridus except pronotum 2.0 times as long as wide, its anterior margin armed by 12 serrations.

Elytra 2.7 times as long as wide, 1.4 times as long as pronotum; outline and disc as in hybridus except posterior emargination wider, deeper, and strial punctures in rows, interstriae impunctate. Declivity basically as in hybridus except base with a small, pointed tubercle on interstriae 1, major spine longer, more slender, projecting from its base, about 2.5 times as long as its basal width, lateral margins more strongly elevated, more strongly explanate behind; declivity occupying slightly more than posterior third of elytral length, declivity from base to apex of suture equal in length to lateral processes from end of suture to their apices; apical emargination narrowly U-shaped, three-fifths as wide as long; lateral process with an acute denticle on inner margin one-third of process length from its apex; declivital face shining, subreticulate, punctures not clearly indicated.

Distribution.- Panama and Venezuela.
Panama: Volcán de Chiriquí, G. C. Champion. venezuela: Rancho Grande in Pittier Nat. Pk., Aragua, 9-IV-70, 1100 m, No. 431 in Nectandra, No. 432 in Guttiferae near Vismia, S. L. Wood.

Biology.- Venezuelan specimens were taken from dying branches $2-6 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotype and on three identical male specimens from Venezuela.

## 12. Amphicranus mirandus Wood

Amphicranus mirandus Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):63 (Holotype, female: Rincón de Osa, Puntarenas, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from hybridus Blandford by the pronounced sexual dimorphism, by the cleft female epistoma, by the more slender antennal club, by the absence of an elevated line on the lateral margins of the pronotum, and by the very different declivity.

Female.- Length $2.5-2.8 \mathrm{~mm}$ (males $2.8-3.5 \mathrm{~mm}$ ), 3.3 (male 3.9) times as long as wide; color yellowish brown except anterior third of pronotum and elytral declivity darker brown.

Frons convex above, weakly, transversely impressed just below upper level of eyes, epistomal area protuberant and sharply cleft on median line from epistomal margin to transverse impression; surface subrugose-reticulate, a few fine punctures obscurely indicated; glabrous except along epistomal margin and on sides of head near eyes. Antennal funicle 2 -segmented; club 1.6 times as long as wide, oval, sutures weakly procurved, posterior face with some long hair.

Pronotum 1.4 times as long as wide; widest at base, sides straight but distinctly converging on basal three-fourths, very broadly rounded in front; anterior margin unarmed; summit on anterior fifth; anterior slope very steep, asperities rather sparse; posterior areas finely reticulate, punctures minute, obscure. Glabrous.

Elytra 1.9 times as long as wide, 1.4 times as long as pronotum; sides almost straight and parallel on basal three-fourths, a broad, rather deeply U-shaped emargination behind between lateral processes; declivity confined to posterior two-fifths; disc as in hybridus.

Declivity basically as in hybridus; interstriae 1 at base with a minute tubercle, 2 with a slender spine about three times as long as its basal width; lateral margin following same course as in hybridus but only weakly elevated and not serrate; lateral processes about as long as their basal widths, separated by slightly greater distance than depth of emargination between them; mesal margin of terminal processes bearing a strongly elevated, laterally compressed, longitudinal process, its upper margin horizontal, its posterior margin subvertical. Disc glabrous, rather sparse, fine hair on declivity.

Male. - Similar to female except frons broadly convex, epistomal area normal; anterior margin of pronotum vertical, appearing shallowly, broadly emarginate from dorsal aspect; declivital spines and lateral processes distinctly longer; lateral declivital processes with margins directed mesad (not dorsad) thereby forming a pronounced constriction in area of emargination just anterior to its middle; face of declivity glabrous.

Distribution. - Costa Rica.
COSTA RICA: Rincón de Osa, Puntarenas, lI-V111$66,30 \mathrm{~m}$, No. 85 , tree limb, S. L. Wood.

Biology.- Specimens were taken from a broken limb $5-15 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 32 specimens.

## 13. Amphicranus ursus Schedl

Amphicranus ursus Schedl, 1934, Ent. Blätt. 30:37 (Holotype, female?: San José, Costa Rica: Schedl Coll.)
Diagnosis.- This species is distinguished from speciosus Schedl and scitulus Wood by the much larger size, by the absence of a raised, granular area on the frons, and by the very different declivity described below.

Female(?).- Length $7.3 \mathrm{~mm}, 3.7$ times as long as wide; color uniformly dark brown.

Frons broadly convex, with an abruptly impressed, rather deep, narrow cleft extending entire width immediately above epistoma; surface dull, minutely reticulate, fine, rather sparse punctures indicated; glabrous. Antennal club 1.7 times as long as wide.

Pronotum 1.4 times as long as wide; as in female scitulus except anterior margin more broadly rounded, asperities near summit lower, more nearly scalelike, and posterior
areas more strongly reticulate, with punctures much finer. Glabrous.

Elytra 2.2 times as long as wide, 1.2 times as long as pronotum; outline about as in scitulus except very strongly explanate, Ushaped sutural notch twice as deep as wide; striae not impressed, punctures minute, shallow, obscure, in rows; interstriae shining, almost smooth, more than six times as wide as striae, an occasional puncture present. Declivity abrupt, very steep, very strongly excavated; surface of excavated area smooth, shining, punctures minute, obscure, confused; basal margin armed on interstriae 3 by a pair of small, pointed tubercles at apex of a base forming a 90 degree angle, mesal margins of base converging anteriorly toward suture at 70 degree angle, lateral margins extending to major spine; major spine somewhat subquadrate, from lateral aspect its base wider than its height; notch between major spine and ventrolateral process deep, its outline obtusely rounded; each ventrolateral process broad, slightly wider than sutural notch, its apex rather broadly rounded; distance from apex of minor spine to apex of major spine equal to distance from sutural apex to apex of ventrolateral process. Glabrous except for sparse, fine, short hair on margins of declivity.

Distribution.- Costa Rica.
COSTA RICA: San José, Vi-24, 1000-1500 m, F. Nevermann.

Notes.- The above treatment was based on the holotype.

## 14. Amphicranus tornatilis Wood

Amphicranus tornatilis Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):64 (Holotype, female; 6 km S San Vito. Puntarenas, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from spectabilis (Wood) by the larger size, by the color, by the coarsely serrate, more narrowly rounded anterior margin of the pronotum, and by the more gradual, more strongly explanate elytral declivity.

Female.- Length $2.5-2.8 \mathrm{~mm}, 3.5$ times as long as wide; color yellowish brown with head, anterior half of pronotum, and posterior half of elytra black.

Frons as in spectabilis.

Pronotum 1.6 times as long as wide; as in spectabilis except anterior margin more narrowly rounded and armed by nine coarse serrations, median one prominent, and posterior areas less strongly reticulate, more shining.

Elytra 1.9 times as long as wide, 1.3 times as long as pronotum; as in spectabilis except dise very smooth, brightly shining, declivity not as steep, posterior margin more strongly explanate, and upper slope of lower major prominence on margin of declivity horizontal (as in speciosus Schedl), not ascending. Glabrous.

Distribution.- Costa Rica.
COSTA RICA: 6 km S San Vito, Puntarenas. 19-21-III-67, tree, D. D. Sliwa.

Notes. - The above treatment was based on the type series of eight specimens.

## 15. Amphicranus speciosus (Sched!)

Tricolus speciosus Schedl. 1934, Ent. Blätt. 30:38 (Holotype, sex?: Hamburgfarm on Río Reventazón. Limón, Costa Rica; Schedl Coll.)
Diagnosis.- This species is distinguished from spectabilis (Wood) by the more poorly developed second process on the lateral margin of the declivity, and, perhaps, by other characters.

Addlt.- Length $2.2 \mathrm{~mm}, 3.1$ times as long as wide; as in spectabilis except as noted in above diagnosis. Granular area on frons more definite, about twice as extensive. Declivital process 2 descending on its apical half of the anterior slope.

Distribution.- Costa Rica.
COSTA RICA: Hamburgfarm on Río Reventazón. Limón, Costa Rica, 2-VI-29, at light, F. Nevermann; Guápiles, Limón, 22-VII-66, 100 m , tree, S. L. Wood.

Notes. - The above treatment was based on a brief comparison of the holotype of speciosus and the allotype of spectabilis. The two forms are very similar. Because the series of six specimens of spectabilis is entirely consistent in declivital structure, speciosus is either an aberrant specimen or a distinct species. The two type localities are within a few kilometers of one another in Limón Province, Costa Rica.

## 16a. Amphicranus spectabilis (Wood)

[^23]Diagnosis.- This species is distinguished from speciosus (Schedl) by the more strongly projecting declivital spine 2 that is horizontal or ascending on apical half of its dorsal margin and by the larger, more clearly defined granular area on the frons.

Female.- Length 2.3-2.5 mm, 3.0 times as long as wide; color very dark brown.

Frons not visible, head withdrawn into prothorax in all specimens except allotype, evidently as in male, described below.

Pronotum 1.3 times as long as wide; sides subparallel but feebly arcuate on basal half then convergently arcuate to narrowly rounded, subserrate, anterior margin; asperities decreasing in size posteriorly, ending at or before summit; posterior area subreticulate, finely, deeply, rather sparsely punctured; glabrous.

Elytra 1.7 times as long as wide, 1.3 times as long as pronotum; sides almost straight and parallel to level of middle of declivity, then very broadly rounded behind, with a rather broad, deep, sutural emargination; strial punctures fine, shallow, in rather indefinite rows; interstriae smooth, with a few irregularly placed punctures identical to those of striae. Declivity begimning two-thirds elytral length from base, broadly, deeply excavated, with upper and lateral margins acutely, rather strongly elevated except rounded on interstriae 1; upper margin armed on interstriae 2 by a small, pointed tooth; a second prominence on lateral margin just below middle, its basal margins in lateral profile forming a 90 degree angle (somewhat blunt); acute margin continuing to apex; profile as in speciosus except second prominence higher; excavated area broadly concave, shining, sutural interstriae finely, not strongly elevated, smooth, remaining area finely, rather closely punctured. Glabrous.

Male.- Similar to female except serrations on anterior margin of pronotum much more prominent. Frons rather strongly, broadly convex; surface reticulate and rather coarsely, deeply punctured except on a small, more coarsely reticulate, impunctate area below upper level of eyes equal in diameter to one-fifth width of frons; vestiture limited to epistomal area.

Distribution.- Costa Rica.

COSTA RICA: Finca La Lola, Limón, 22-VI-63, No. 53, Theobroma cacao, J. L. Saunders.

Notes.- The above treatment was based on the type series of six specimens.

## 16b. Amphicranus spectus Wood

Amphicranus spectus Wood, 1980, Great Basin Nat. 40:358 (Holotype, male; Pichucalco, Chiapas, Mexico; Wood Collection)
Diagnosis.- This species is distinguished from spectabilis Wood by the larger size, by the more elongate antennal club, with more strongly arcuate sutures, by the more shallowly impressed elytral punctures, and by the more strongly, more acutely elevated lateral margin of the elytral declivity from base to apex.

Male.-Length $2.9 \mathrm{~mm}, 3.2$ times as long as wide; color reddish brown (fully mature?).

Frons about as in spectabilis except surface more finely punctured, raised median granular area slightly larger (occupying almost median third), much more sharply defined. Antennal club more slender, 1.5 times as long as wide, sutures more strongly arcuate than in spectabilis.

Pronotum 1.6 times as long as wide; about as in spectabilis except punctures on posterior areas slightly smaller.

Elytra 1.8 times as long as wide, 1.13 times as long as pronotum; similar to spectabilis except punctures on disc very shallow, obscurely impressed, declivity more deeply excavated, lateral margin more acutely, more strongly elevated, more strongly explanate below, basal area of spine 1 protruding slightly.

Distribution.- Chiapas.
MEXICO: Chiapas: Pichucalco, 26-III-80, Theohroma сасао.

Notes. - The above treatment was based on the holotype.

## 17. Amphicranus collaris Blandford

Fig. 215
Amphicranus collaris Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):294 (Holotype, female?; Volcán Chiriquí, Panama; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished by the coloration, by the quadrate declivital spine 3 , with a distinct notch between it and
subapical posterior margin of the declivity, and by other characters.

Female. - Length $3.5-4.0 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown, with elytra and abdomen black.

Frons convex, lateral areas transversely impressed immediately above epistomal margin; surface rugose-reticulate, punctures obscure; raised granular area entirely above eyes, more than 3.0 times as wide as long; vestiture sparse, inconspicuous except for narrow epistomal brush. Antennal funicle 3 -segmented; club somewhat obovate, 1.3 times as long as wide, sutures weakly procurved.

Pronotum 1.25 times as long as wide; sides feebly arcuate, subparallel on more than basal half, narrowly rounded in front; anterior margin acutely elevated, shallowly serrate; summit one-third pronotum length from anterior margin, indefinite; asperities on anterior slope coarse, low; posterior areas finely reticulate, punctures very minute. Glabrous.

Elytra 1.6 times as long as wide, 1.3 times as long as pronotum; sides almost straight and parallel to level of apex of suture, broadly rounded behind and narrowly, deeply emarginate at suture; declivity occupying slightly less than posterior half; dise smooth, shining, punctures minute, confused. Declivity moderately steep, broadly, concavely excavated; basal margin armed at position of interstriae 1 by a small, pointed tubercle, spine 2 rather large, somewhat blunt, about one and one-half times as long as basal width, in position of interstriae 2; lateral margin below spine 2 rounded, not strongly elevated; spine 3 commencing below middle, quadrate, slightly longer than basal width, a conspicuous notch between spine. 3 and posterolateral margin; rather strongly explanate behind; sutural emargination about one and one-half times as deep as wide. Subglabrous.

Male.-Similar to female.
Distribution.- Costa Rica to Panama.
COSTA RICA: Tapantí, Cartago, 17-IX-63, 1300 m , No. 178 in a woody vine, No. 265 in Phoebe mexicana, S. L. Wood. PANAMA: Volcán Chiriquí, Chiriquí, G. C. Champion.

Biology.- Specimens were taken in stems $5-8 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotype and on 14 other specimens.

## 18. Amphicranus belti Blandford

Fig. 215
Amphicranus belti Blandford, 1905, Biol. Centr. Amer.. Coleopt. 4(6):292 (Holotype, sex?: Chontales, Nicaragua; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished by the distinctive coloration, by two pairs of denticles arming the basal margin of the elytral declivity, by the very strongly explanate posterior margin of the declivity, and by other characters.

Male.- Length 6.5-7.0 mm, 3.6 times as long as wide; color bright reddish brown except anterior third of pronotum, posterior half of elytral disc, and all of declivity, head, and most of abdomen black.

Frons convex (an irregular serpentous callus on my specimen evidently an aberation); surface finely rugose-reticulate; oval area on median half from epistoma to upper level of eyes granular. Antennal funicle 3 -segmented; club somewhat obovate, 1.6 times as long as wide, sutures narrowly, rather strongly procurved.

Pronotum 1.4 times as long as wide; sides almost straight and parallel on basal twothirds, rather broadly rounded in front; anterior margin irregularly costate; summit indefinite, anterior eighth abruptly declivous, asperities not clearly defined; surface finely reticulate, punctures very minute. Glabrous.

Elytra 2.2 times as long as wide, 1.6 times as long as pronotum; declivity commencing slightly anterior to middle; disc smooth, surface punctures almost obsolete. Declivity abrupt at base, then gradual, broadly, extensively excavated; basal margin with a stout, moderately large, pointed denticle at position of interstriae 1 , interstriae 2 with a small irregularity suggesting a minute denticle, interstriae 3 with a denticle similar to but slightly larger than that on 1 , posterolateral margin acutely, strongly elevated to apex, a small, blunt denticle on its median margin at level of sutural apex; subapical margin profoundly explanate, deeply, rather narrowly emarginate at suture, emargination more than three times as deep as wide; face of declivity almost smooth, shining. Subglabrous except explanate portion with moderately abundant, fine, rather short hair.

Distribution. - Nicaragua to Costa Rica.
nicaracua: Cbontales, Belt. COSTA RICA: 6 km S San Vito, Puntarenas. 14-III-67.

Notes. - The above treatment was based on my San Vito specimen. The holotype was also examined, but the two specimens were not compared directly.

## 19. Amphicranus torneutes Blandford

Fig. 215
Amphicranus torneutes Blandford, 1905. Biol. Centr. Amer., Coleopt. 4(6):292 (Holotype, sex?; Chilpancingo, Guerrero, Mexico; British Mus. Nat. Hist.)
Holotype.-Sex? Length $5.8 \mathrm{~mm}, 3.86$ times as long as wide; color medium brown, with basal half of elytral dise lighter brown.

Distribution.- Guerrero.
MEXICO: Guerrero: Chilpancingo, June, 4000 ft ., H. H. Smith.

Notes.- The holotype is identical to belti Blandford except that it is slightly smaller, more slender, and the coloration is slightly different. In a genus where these features are so unreliable and where so few specimens of these exceedingly rare species are available for study, reliable taxonomic judgements cannot be made. Although torneutes is listed here as a species, it probably does not warrant a rank higher than subspecies.

## 20. Amphicranus balteatus Blandford Fig. 215

Amphicranus balteatus Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):291 (Holotype, sex?; Cerro Zunil, Quezaltenango, Guatemala; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from belti Blandford by the larger size, by the color pattern, by the less precipitous, more nearly rounded anterior declivous area of the pronotum, and by details of the declivital structure.

Female.- Length $7.5-8.0 \mathrm{~mm}, 3.5$ times as long as wide; color yellowish brown, head, pronotum, and elytral declivity dark brown to black.

Frons largely concealed in specimens at hand, evidently as in belti.

Pronotum 1.3 times as long as wide; anterior fifth less abruptly declivous, asperities more numerous and more clearly defined, anterior margin more irregular.

Elytra 2.0 times as long as wide; essentially as in belti except denticles on interstriae 1 and 2 at base of declivity subequal in size and shape, denticle on interstriae 3 conspicuously
larger, posterior margin less profoundly explanate, sutural emargination about twice as deep as wide.

Male.-Similar to female.
Distribution.- Guatemala.
gUatemala: Cerro Zunil, G. C. Champion; Volcán Pacaya, Esquintla, 1-VI-64, 1300 m . No. 688, Caldo de Frijol, S. L. Wood.

Biology.- One pair of specimens was taken from a Platypus tunnel 8 cm deep in a recently cut tree 30 cm in diameter. Presumably these specimens had evicted the Platypus, but they had not altered the tunnel prior to their capture.

Notes. - The above treatment was based on the pair from Volcan Pacaya, which had been compared directly to the holotype.

## 21. Amphicranus macellus Wood

Amphicranus macellus Wood, 1974, Brigham Young
Univ. Sci. Bull., Biol. Ser. 19(1):64 (Holotype, female; Rincón de Osa, Puntarenas, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from balteatus Blandford by the much smaller size, by the color, by the absence of a granular area on the frons, by details of the declivital sculpture, and by other characters.

Male.- Length $1.8-1.9 \mathrm{~mm}, 4.0$ times as long as wide; color yellowish brown.
Frons uniformly convex; surface evidently minutely rugose-reticulate. Antennal funicle 3 -segmented; club 1.3 times as long as wide, broadly oval, sutures rather weakly procurved.

Pronotum 1.8 times as long as wide; sides straight and almost parallel on basal threefourths, rather narrowly rounded in front; anterior margin acutely elevated, subserrate except median serration slightly larger and basally separate from marginal costa; indistinct summit on anterior fourth; anterior slope steep, convex, most conspicuous asperities arranged in a subtransverse row; surface subreticulate, punctures small, very shallow. Glabrous.

Elytra 2.4 times as long as wide, 1.4 times as long as pronotum; outline as in balteatus except apical emargination wider, U-shaped; disc smooth, strial punctures fine, shallow, in rows. Declivity broadly, deeply excavated much as in balteatus except steeper and somewhat less strongly explanate; basal
margin with spines on interstriae 1 and 2 minute, spine on 3 moderately large, pointed, lateral margin acutely, strongly elevated to small denticle on mesal side at level of sutural apex, margin obliquely descending from denticle to apex of lateral process on a straight line; sutural emargination narrowly U-shaped, 1.5 times as deep as wide; declivital face reticulate, shining, punctures very obscurely indicated. Glabrous.

Female.- Similar to male except declivity less strongly explanate, its lateral margins less strongly elevated; sutural emargination as long as wide.

Distribution.- Costa Rica.
COSTa RICA: Rincón de Osa, Puntarenas, 11-VIII$66,30 \mathrm{~m}, \mathrm{No} .85$, tree limb, S. L. Wood.

Bıology.- Specimens were taken from a recently broken limb 10 cm in diameter.

Notes.- The above treatment was based on the type series of four specimens.

## 22. Amphicranus tenuis Blandford

 Fig. 215Amphicranus tenuis Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):295 (Holotype, female; "Mexican" tobacco refuse; British Mus. Nat. Hist.)
This species was named from one specimen intercepted at Paris from tobacco crates that supposedly came from Mexico. As with several other species named by Blandford from this same source, all indications are that they came from Brazil, not Mexico. In addition to the type, I have seen one specimen from Campimento Río Grande near El Palmar, Bolivar, Venezuela.

## 23. Amphicranus parilis Wood

Amphicrantus parilis Wood, 1975, Great Basin Nat. 35:31 (Holotype, male: 6 km or 4 miles W Tepic, Nayarit, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from filiformis Blandford by the much smaller size, by the absence of minute crenulations on the base of the pronotal disc, and by differences on the elytral declivity indicated below.

Male.- Length $2.0 \mathrm{~mm}, 4.0$ times as long as wide; color pale yellowish brown, elytral declivity brown.

Frons and pronotum as in filiformis except as noted in above diagnosis. Elytra as in filiformis except less strongly explanate, sutural
emargination only slightly deeper than wide (twice as deep as wide in filiformis), declivital spine 2 smaller, less strongly pointed.

Distribution.- Nayarit.
MEXICO: Nayarit: 6 km W Tepic, 13-VII-65, 1000 m . No. 240 , tree branch, S. L. Wood.

Notes. - The above treatment was based on the holotype.

## 24. Amphicranus filiformis Blandford Fig. 215

Amphicranus filiformis Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):295 (Holotype, sex?; Omilteme, Guerrero, Mexico; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from belti Blandford by the smaller size, by the absence of a granular area on the frons, and by the details of the declivital sculpture described below.

Holotype. - Sex? Length $3.7 \mathrm{~mm}, 4.2$ times as long as wide; color pale brown, elytral declivity very dark brown.

Frons convex; surface uniformly rugosereticulate, punctures obscure; apparently glabrous. Pronotum about as in macellus Wood except asperities on anterior slope slightly larger, disc more nearly shining, basal third of dise with several minute crenulations. Elytra as in hybridus Blandford except more strongly explanate, lower tubercle on suture entirely absent, posterolateral margin more strongly elevated, angulate, and armed by a rather coarse spine at level of sutural apex, this spine displaced mesad from margin and directed mesad, its base extending from margin almost one-fourth distance to apex of suture; face of declivity moderately pubescent, setae short on basal half, very long on lower half.

Distribution.-Guerrero.
MEXICO: Chiapas: 21 km N Ocozocoautla, 2-VII-69. Guerrero: Omilteme, VIII, 8000 ft , H. H. Smith.

Notes.- The above treatment was based on the holotype and on one other specimen.

## 25. Amphicranus cordatus (Bright)

Tricolus cordafus Bright, 1972. Canadian Ent. 104:1380 (Holotype, male; 184 km S Oaxaca on Highway 131, Oaxaca, Mexico; Canadian Nat. Coll., 12651).

Diagnosis.- This species is distinguished from Tricolus by the quadrate precoxal piece on the prothorax, and by the two pairs of
minor spines on interstriae 1 and 3 on the basal margin of the declivity. It is distantly allied to propugnatus Blandford, from which it is distinguished by characters included in the above key.

Male.- Length $2.8 \mathrm{~mm}, 3.0$ times as long as wide; color yellowish brown, with anterior two-fifths of pronotum and elytral declivity very dark brown.

Frons convex, weakly, transversely impressed above epistoma; lateral areas shining, moderately punctured, subaciculate below upper level of eyes; median area with a broadly heart-shaped granulate area on median third, its upper third extending above upper level of eyes; vestiture sparse except on epistomal margin. Antennal club broadly ovate, almost subcircular, sutures indicated on middle third.

Pronotum 1.4 times as long as wide; about as in propugnatus except asperities on anterior slope distinctly smaller.

Elytra 2.0 times as long as wide, 1.5 times as long as pronotum; essentially as in propugnatus except major spine 1 cylindrical, about twice as long as minor spines, its apex bluntly rounded; lateral margin smooth from spine 1 to ventrolateral process; ventrolateral process quadrate, slightly compressed laterally, only slightly longer than basal width.

Distribution.- Oaxaca.
MEXICO: Oaxaca: 184 km S Oaxaca on Highway 13I, 12-V-71, 2000 m , D. E. Bright.

Notes.- The above treatment was based on the holotype.
26. Amphicranus propugnatus Blandford Fig. 215

Amphicranus propugnatus Blandford, 1905, Biol. Centr. Amer., Coleopt. $4(6): 297$ (Holotype, female?; Cerro Zunil, Quezaltenango, Guatemala; British Mus. Nat. Hist.)
Amphicranus armatus Schedl, 1934, Ent. Blätt. 30:37 (Holotype, female?: Turrialba, Costa Rica; Schedl Coll.). Probably synonymy
Diagnosis.- This species is distinguished from spinosus Wood by the frons, by the arrangement of the declivital spines, and by the fine, raised line on the lateral margins of the pronotum.

Female.- Length $3.5 \mathrm{~mm}, 4.1$ times as long as wide; color dark brown, elytral dise lighter.

Frons strongly, broadly convex except moderately, transversely impressed above epistoma; granular area covering almost entire convex portion on slightly more than median three-fourths.

Pronotum as in spinosus except asperities on anterior slope slightly smaller; lateral margins marked by a fine, raised line.

Elytra basically as in spinosus except for declivital spines; basal margin of declivity arned by small, pointed spines on interstriae 1 and 3 , first major spine large, quadrate, laterally compressed, a smaller, compressed, subtriangular spine at base of ventrolateral process, ventrolateral processes subcylindrical, slightly shorter than in spinosus.
Distribution.- Guatemala.
gUatemala: Cerro Zunil, Quezaltenango, G. C. Champion. COSTA RICA: Turrialba, XI-28, Schild.

Notes. - The above treatment was based on the holotype of propugnatus. The holotype of armatus Schedl fits this species completely except that it is 4.5 mm in length. Both types were examined, but were not compared to one another nor to other specimens of the same species.

## 27. Amphicranus spinescens Wood

Amphicranus spinescens Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):65 (Holotype, female; Rincón de Osa, Puntarenas, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished by the absence of a fine, raised line on the lateral margins of the pronotum, by the very coarse, slender serrations on the anterior margin of the pronotum, and by the different armature on the elytral declivity.

Female.- Length $2.0-2.4 \mathrm{~mm}, 4.4$ times as long as wide; color yellowish brown, anterior half of pronotum and posterior third of elytra a darker brown.

Frons transversely concave, lower third weakly, transversely impressed, surface ru-gose-reticulate except subgranular on oval area on median half at upper level of eyes; vestiture confined to epistomal margin. Antennal funicle 3 -segmented; club oval, 1.4 times as long as wide.

Pronotum 1.8 times as long as wide; sides straight and parallel on basal two-thirds, narrowly, strongly produced in front; anterior margin armed by $10-12$ very coarse, basally
separate serrations, median ones slender; summit on anterior third; anterior slope moderately steep, convex, anterior asperities coarse, smaller toward summit; posterior areas finely reticulate, punctures minute, almost obsolete. Glabrous.

Elytra 2.4 times as long as wide, 1.4 times as long as pronotum; sides straight and parallel to declivity, broadly emarginate behind, posterolateral angles produced into long forcepslike processes; disc smooth, subshining, strial punctures almost obsolete. Declivity steep, excavated; basal margin subacutely elevated, armed by three small, pointed denticles, one each at interstriae 1,2, and 3; lateral margin subacutely elevated, bearing just below middle of declivity a very large, cylindrical, blunt spine 3.5 times as long as its basal width, directed caudad; below this spine lateral margin continues to apex of ventrolateral process; ventrolateral process subcylindrical, curving slightly mesad, its length, measured from apex of suture, equal to more than half width of elytra; posterior emargination very broad, deeply, broadly U-shaped, very slightly deeper than wide.

Male.- Similar to female except declivital spines slightly longer.

Distribution.- Costa Rica.
COSTA RICA: Rincón de Osa, Puntarenas, I1-VIII$66,30 \mathrm{~m}$, No. 85 , tree limb, S. L. Wood.

Biology.-Specimens were taken from the same limb that contained marcellus Wood.

Notes. - The above treatment was based on the type series of 20 specimens.

## 28. Amphicranus spinosus Wood

Amphicranus spinosus Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):65 (Holotype, female; Rincón de Osa, Puntarenas, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from spinescens Wood by the larger size, by the finely punctured pronotal disc, and by the more brightly shining elytra.

Female.- Length $2.7-3.0 \mathrm{~mm}, 4.0$ times as long as wide; color brown.

As in spinescens except posterior areas of pronotal disc reticulate, with moderately abundant, fine, distinctly impressed punctures in both discal and lateral areas, and elytra much more brightly shining.

Male.- Similar to female except declivital spine slightly longer.

Distribution.- Costa Rica.
COSTA RICA: Rincón de Osa, Puntarenas, Il-VIII$66,30 \mathrm{~m}$, No. 85 , tree limb, S. L. Wood.

Biology. - Specimens were taken from the same limb that contained spinescens.

Notes.- The above treatment was based on the type series of four specimens.

## 29. Amphicranus mucronaths Wood

Amphicranus mucronatus Wood, I974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(I):66 (Holotype, female; Volcán de Chiriquí at Cerro Punta, Chiriquí, Panama; Wood Coll.)
Diagnosis.- This species is distinguished from fastigiatus Blandford by the smaller size, by the very different female frons, and by the narrower posterolateral elytral process of the male on which the spine at the level of the sutural apex is positioned equidistant from the lateral and mesal margins (not on the lateral margin as in fastigiatus).

Female. - Length $2.7 \mathrm{~mm}, 4.0$ times as long as wide; color light brown, pronotum and elytral declivity darker.

Frons convex, reticulate below upper level of eyes, shining above, punctures fine, moderately abundant, obscure on reticulate area; median fourth from epistoma to more than half distance to upper level of eyes with a sharply elevated, low, oval, granulate area; vestiture inconspicuous. Antennal club transversely oval, slightly wider than long.

Pronotum 1.7 times as long as wide; as in fastigiatus except submarginal grooves and callus on anterior slope much more poorly developed.

Elytra as in fastigiatus except discal punctures slightly smaller.

Male.- Length $3.0-3.3 \mathrm{~mm}$; similar to male fastigiatus except antennal club slightly more broadly oval; anterior margin of pronotum more strongly, narrowly acuminate, process on its ventral surface almost obsolete; elytral declivity slightly less strongly explanate. lateral margins much less strongly elevated, denticles on basal margin much smaller, denticle at level of sutural apex in center of floor of lateral process (not on inner surface of lateral margin as in fastigiatus).

Distribution.- Panama.

PANAMA: Cerro Punta near Volcán Chiriquí, Chiriquí, Il-I-64, 1800 m , No. 376, tree branch, S. L. Wood.

Notes.- The above treatment was based on the type series of three specimens.

## 30. Amphicranus fastigiatus Blandford

 Fig. 215Amphicranus fastigiatus Blandford, 1905, Biol. Centr. Amer., Coleopt. 466):296 (Holotype, male; Cerro Zunil, Quezaltenango. Guatemala)
Diagnosis.- The female of this species is distinguished from the female of dorni (Eichhoff) by the slightly different frons, by the subcircular antennal club, by the more obtuse anterior margin of the pronotum, and by the very different elytral declivity, and in the male by the bifid tubercle on the ventral side of the pronotal mucro and by details in sculpture of the elytral declivity.
Female.- Length 2.7-3.2 mm, 4.0 times as long as wide; color dark brown, elytral disc, legs, and antennae yellowish brown.

Frons convex, slightly protuberant in median area on lower half; a small, median, epistomal tubercle; entire surface rugose-reticulate from epistoma to well above upper level of eyes. Antennal club broadly oval, slightly longer than wide.

Pronotum 1.8 times as long as wide; widest at base, sides almost sraight and converging slightly on more than basal half, moderately constricted, then narrowly, obtusely rounded; summit indefinite, on anterior fourth; anterior margin costate, unarmed, a broad submarginal groove just above margin, above this an obtuse costa, and above this a second broad groove, all following contour similar to anterior margin; surface reticulate, punctures very fine, deep. Glabrous.

Elytra 2.3 times as long as wide, 1.4 times as long as pronotum; sides almost straight and parallel on more than basal two-thirds, slightly narrowed to level of sutural apex, then rather abruptly rounded, strongly, rather broadly emarginate behind; disc smooth, shining, punctures rather small, distinct, close, confused (obscure striae discernible in some posterior areas). Declivity occupying posterior third of elytra, extensively, subconcavely impressed; lateral margins moderately, obtusely elevated, a small, pointed denticle at position of interstriae 3, a strongly elevated, narrow costa extending caudomesad from lateral margin to position
of interstriae 3 then continued caudad and ending abruptly just before level of sutural apex; subacute lateral margin continued from interstriae 4 to apex of explanate lateral process; apex emarginate on median fifth of elytral width, emargination as deep as wide; excavated area reticulate, punctures obscure. Sparse, fine hair in excavated area of declivity.

Male.- Length 3.7-4.2 mm; as in female except lower frons not inflated or tuberculate, median third granular to upper level of eyes; anterior third of pronotum converging to an acute median mucronate point, feebly declivous, ventral surface of mucro bearing a strongly developed bifid tubercle; elytral declivity much more strongly excavated and explanate, basal margin armed by small tubercles on interstriae 1 and 2, a larger spine on 3, lateral margins strongly, acutely elevated to apex, a small tubercle on median surface of lateral margin at level of sutural apex (dorni with an additional tubercle at dorsocaudal angle of lateral process).

Distribution.- Guatemala to Costa Rica.
guatemala: Cerro Zunil, Quezaltenango, G. C. Champion. COSTA RICA: 15 km SE Cartago, Cartago, 29-VII-63, 1800 m , No. 17, in Conostegia oerstediana, No. 90 in fallen tree, S. L. Wood; San José, 7-1I-33, Parkinsonia aculcata, C. H. Ballon.

Biology.- Specimens were taken from boles 10 cm and 30 cm in diameter. This species is polygynous; the gallery system is as in Monarthrum.

Notes.- The above treatment was based on seven specimens, one of which was compared to the holotype.

The genus Steganocranus was named to include dorni and subsequently described species in this species group. Except for the strongly mucronate anterior margin of the male pronotum and modified female maxillae, these species are not particularly distinctive. In my opinion, this group is not sufficiently different to warrant generic rank. Other species groups are just as distinctive, but have been retained within Amphicranus.

Genus MONARTHRUM Kırsch

Monarthrum Kirsch, 1866, Berliner Ent. Zeitschr. 10:213 (Type-species: Monarthrum chapuisi Kirsch, monobasic)

Corthylomimus Ferrari, 1867, Die Forst- und Baunzuchtschädlichen Borkenkäfer, p. 48 (Typespecies: Bostrichus fasciatus Say, subsequent designation by Hopkins, 1914, Proc. U.S. Nat. Mus. 48:118); Eichhoff. 1869, Berliner Ent. Zeitschr. 11:300. Synonymy
Cosmocorynus Ferrari, 1867, Die Forst- und Baumzuctschälichen Borkenkäfer, p. 62 (Typespecies: Cosmocorynus cristatus Ferrari, monobasic); LeConte, 1876, Proc. Amer. Philos. Soc. 15:348. Synonymy
Pterocyclon Eichhoff, 1869, Berliner Ent. Zetischr. 12:276 (Type-species: Pterocyclon laterale Eichhoff, subsequent designation by Hopkins, 1914, Proc. U.S. Nat. Mus. 48:128); Eichhoff, 1869, Berliner Ent. Zeitschr. 12:299. Synonymy
Anchonocerus Eichhoff, 1878, preprint of Mém. Soc. Roy. Sci. Liége 2(8):431 (Type-species: Anchonocerus rufipes Eichhoff, monobasic); Wood, 1977, Great Basin Nat. 37:512. Synonymy
Phthorius Eichhoff, 1878, preprint of Mém. Soc. Roy. Sci. Liége 2(8):433 (Type-species: Phthorius ingens Eichhoff, monobasic); Eggers, 1935, Rev. de Ent. 5:329. Synonymy
Trypocranus Eichhoff, 1878, preprint of Mém. Soc. Roy. Sci. Liége 2(8):4:35 (Type-species: Trypocranus cincinnatus Eichhoff, monobasic) (Type lost, suspected synonymy cannot be proved.)
Diagnosis.- This large, diverse, difficult genus is distinguished from other members of the tribe by the 2 -segmented funicle, by the presence of a fine, raised line on the lateral margin of the pronotum, (usually) by the horizontal precoxal piece of the prosternum that is usually subacutely pointed and directed between the anterior coxae, and by the dimorphic protibiae that are subinflated and armed on the posterior face by numerous small, confused tubercles.

Description.- Length $1.4-4.8 \mathrm{~mm}$, 2.4-3.4 times as long as wide; color yellowish brown to very dark brown, many species bicolored.

Frons convex and variously, conservatively sculptured in males, females usually similar to male, some concave or elaborately impressed, glabrous to elaborately ornamented by hair. Eye oval, deeply emarginate, usually finely faceted. Antennal scape slender to triangular, finely pubescent in female of some species; funicle 2 -segmented; club slender to broadly oval, strongly triangular in females of a few species, sutures almost always present, straight to moderately procurved, posterior face usually ornamented by long hair in female. Pronotum longer than wide, summit at or in front of middle; anterior slope asperate, anterior margin serrate in
male, margin usually unarmed in female; posterior areas very finely sculptured. Scutellum rather large, flat. Elytra very finely sculptured, punctures confused in most species; declivity very gradual to subvertical, convex to elaborately excavated, unarmed to armed by conspicuous spines; sutural apex entire to conspicuously emarginate. Vestiture usually absent except on declivity.

Anterior coxae contiguous, tibiae dimorphic, posterior face subinflated in female and armed by numerous confused tubercles. Prothoracic precoxal piece horizontal, its posterior margin subacute and directed between coxae.
Distribution.- United States to Argentina; approximately 100 species are known; 58 occur in North and Central America.

Biology.- These ambrosia beetles usually attack cut or dying logs and limbs larger than 30 cm in diameter; however, a few tropical
forms breed in branches and woody vines as small as 3 cm in diameter. Most species are polygynous, but apparently some of the smaller species may be monogamous. The male initiates the attack on a new host and forms the radial entrance tunnel and nuptial chamber in the xylem tissues. The females, up to seven in some species, cut individual egg galleries that radiate from the nuptial chamber on a transverse plane, often following growth rings. The eggs are deposited in niches in rows on the upper and lower surfaces of the egg tunnel. Each larva enlarges its own niche, presumably feeding on a mixture of host tissues and ambrosial fungi. Young adults emerge through the parental entrance hole.

Notes.- This genus requires considerably more study. Most species are known from very scanty material and almost nothing has been recorded of their basic habits.

## Key to the Species of Monarthrum

1. Male elytral declivity moderately to strongly, broadly excavated, lateral mar-
gins subacutely to profoundly elevated on more than lower half, upper margin
armed by two or three pairs of teeth (usually on interstriae 1, 2, and 3); in
Quercus ........................................................................................................................... 2

- Male elytral declivity basically sulcate, lateral margins rounded, never with more than one tooth on basal margin, most or all of other denticles often mesad of lateral margin; in various hosts including Quercus15

2(1). Larger species; male declivity more gradual, deeply excavated; elytra not emarginate at suture (except in validum, praeruptum, and gnarum); female frons commonly ornamented by long hair or vertex often impressed3

- $\quad$ Smaller species; male declivity steeper, broadly, less strongly excavated; elytra suturally emarginate in both sexes; female frons and vertex convex, not ornamented by long hair ..... 11

3(2). Elytral apex entire at suture in both sexes (except male quercus); base of male declivity armed by two pairs of denticles (three pairs in some huachucae); female vertex either convex or shallowly impressed; female declivity with a row of two to four small tubercles on upper half of interstriae 2 ; female antennal club broadly oval

- Elytral apex suturally emarginate in both sexes; base of male declivity armed by three pairs of denticles; female vertex conspicuously excavated, excavation longer than wide; female declivity armed on upper half by about eight small, confused tubercles; female antennal club subtriangular
4(3). Posterolateral margin of male declivity strongly, uniformly elevated from elytral apex about two-thirds distance to declivital base; female vertex not impressed
- Posterolateral margin of male elytral declivity strongly elevated, but interrupted by a laterally compressed subquadrate process; female vertex shallowly impressed (except quercus)

5(4). Male spine 1 on interstriae 2 at base of declivity blunt, almost absent, lateral margins similar to scutellare but subspinose angle near middle of declivity; type with conspicuous, blunt, conical denticle at middle of excavated area about in line with discal interstriae 3, this denticle entirely absent on left side (abnormality?); Hidalgo; 4.3 mm

1. dentatum (Eggers)

- Male spine 1 at base of declivity present, subspinose angle on lateral margin well above middle of declivity, floor of excavated area entirely unarmed

6(5). Male epistomal process unarmed; female frons with median area on lower half distinctly elevated and punctured as on upper areas, small lateral areas immediately above epistoma ornamented by a few long hairs; British Columbia to Baja California; Quercus; 3.0-3.5 mm
2. scutellare (LeConte)

Male epistomal process armed by a small, median tubercle; female frons weakly impressed below upper level of eyes, almost flat, surface of impressed area much more finely, densely punctured and ornamented by a brush of hair, pubescent area attaining upper level of eyes; Arizona; Quercus; 3.0-3.5 mm
3. huachucae Wood

7(4). Male declivity profoundly explanate, narrowly, deeply divaricate; female vertex convex, frons glabrous 8a

- Male declivity moderately explanate, feebly if at all emarginate at suture; female vertex shallowly impressed, impression as wide or wider than long; female frons variously pubescent (except glabrous in querneus)
8a(7). Larger; male pronotum with nonasperate area on anterior slope of pronotum small, less than 0.2 times as wide as pronotum; basal margin of declivity transversely almost straight, abrupt, lower margin of major spine gradually descending to profoundly elevated ventrolateral margin; Durango; Quercus; male $4.4-4.6 \mathrm{~mm}$, female $3.4-3.8 \mathrm{~mm}$

4. quercus (Wood)

- Smaller; male pronotum with a large, subcircular reticulate area on anterior slope 0.4 times as wide as pronotum; basal margin of declivity arcuate, less abrupt, major spine quadrate, a deep notch between its summit and less strongly elevated ventrolateral margin; El Salvador; Quercus; male 3.5 mm

5. quercivorum Schedl
$8 \mathrm{~b}(7)$. Compressed, quadrate processes on lateral margins of male elytral declivity almost parallel, their upper angles less acute and weakly dentate on mesal side; female frons glabrous (except for small epistomal brush); Michoacán and Hidalgo to Honduras; Quercus; 2.8-3.4 mm
6. querneum Wood

- Compressed, quadrate processes on lateral margins of elytral declivity conspicuously converging dorsally, their dorsomedian angles conspicuously dentate; female frons conspicuously pubescent from epistoma almost to vertex, most setae on median half; Chihuahua and Hidalgo to Panama; Quercus; $3.7-4.3 \mathrm{~mm}$
$9(3)$. Quadrate lateral process on male declivity divided to form a blunt, subcylindrical spine between this process and ventrolateral explanate process; female frons more coarsely punctured, excavation on vertex larger, commencinng very slightly above upper level of eyes; Veracruz to Panama; Quercus; 4.3-4.8 mm

8. validum (Ferrari)

- Large laterally compressed quadrate process on lateral margin of male declivity not subdivided; female frons much more finely punctured, excavation on vertex commencing well above eyes 10

10(9). Male elytral declivity less strongly excavated, entire excavated area reticulate, lateral margins less storngly elevated, less strongly explanate below, denticles on basal margin reduced in size; Guatemala; 4.1 mm

- Male declivity more strongly excavated, most of surface in excavated area smooth, shining, lateral margins more strongly elevated, more strongly explanate below, denticles on basal margin larger; Hidalgo to Chiapas; Quercus; $4.2-4.7 \mathrm{~mm}$

10. gnarum (Schedl)

11(2). Declivital face glabrous in both sexes (a few minute setae in tomicoides); basal margin of male declivity armed by two pairs of pointed teeth, a third pair slightly above middle on lateral margin, floor of excavated area unarmed; female declivity shallowly, broadly excavated, with two pairs of small tubercles on basal margin, a third tubercle at middle of declivity near lateral margin

- Declivital face with some conspicuous pubescence in both sexes; basal margin of male declivity armed by two pairs of denticles on interstriae 1 and 3 , those on 3 much larger, each half of excavated area with a small tubercle near its center; female declivity feebly sulcate, almost flat, interstriae 3 armed by two conspicuous tubercles on upper half of face
12(11). Body larger, stouter; male declivity with spine at base of interstriae 3 very
large, slightly longer than lower spine, lower spine narrowly quadrate, blunt;
color black; Guatemala; $3.2-3.3 \mathrm{~mm} . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .11 . ~ t o m i c o i d e s ~(B l a n d f o r d) ~$
- Smaller, more slender species; denticles at base of male declivity small, of equal size, lower spine cylindrical, pointed; color light brown to bicolored; Costa Rica to Panama; 2.6-2.8 mm

12. bispinum (Blandford)

13(11). Male declivital excavation poorly developed, its margins obtuse, middle half with crescent-shaped elevation on interstriae 3, its upper end armed by a blunt tubercle; Guatemala; 2.7 mm
13. terminatum (Blandford)

- Male declivity more deeply excavated, with margins acute, tubercle on interstriae 3 near middle of declivity not accompanied by an elongate elevation
14(13). Lateral margin of male declivity subacutely elevated, rising gradually from floor of excavated area to crest of lateral margin; spine 1 on basal margin of male declivity rather slender, sharply pointed, spine 2 rather slender, slightly smaller; Puebla to Hidalgo; Quercus; 2.0-2.4 mm 14. cordicticum Wood
- Lateral margin of male declivity on more than lower three-fourths abruptly elevated, elevation as high or higher than its thickness; spine 1 on basal-margin of male declivity smaller, 2 larger and stouter; Guatemala to Panama; Quercus; $2.2-2.4 \mathrm{~mm}$ 15. cordatum (Blandford)

15(1). Male declivity moderately to rather strongly excavated, lateral margins armed
on crest of summit by two or three pairs of denticles ..... 16

- Male declivity shallowly excavated to almost flat, two pairs of denticles usually
arm declivity, lower pair of denticles (or both pairs) displaced mesad from
lateral margin ..... 33

16(15). Larger, stouter species uniformly dark brown in color; frons in both sexes
broadly, evenly convex, glabrous; declivity broad, moderately excavated;
$2.3-4.0 \mathrm{~mm}$

- $\quad$ Smaller, slender species, often bicolored or pale; female frons frequently with various grooves, elevations, or setal ornamentation; $1.4-3.4 \mathrm{~mm}$

17(16). Male declivity with a continuous crest extending from summit of denticle 2 (lower one) to elytral apex; female frons with a distinct, uniformly elevated median carina from epistoma to above upper level of eyes, frontal punctures much coarser near epistoma than above eyes (these characters discernible in male but less clearly defined); Costa Rica; Clusia, Quercus, Podocarpus; $3.5-4.0 \mathrm{~mm}$
16. nevermanni (Schedl)

- Lower denticle on male declivity isolate, not associated with lateral crest; female frons without a carina, punctures more uniform in size18

18(17). Male declivity commencing at or slightly anterior to middle of elytra, denticle 1 closer to apex than to base of declivity; female declivity normal; female frons feebly impressed immediately above epistoma, median epistomal process not evident, lower two-thirds of area below upper level of eyes rugose-reticulate, area above eyes almost smooth between punctures; Costa Rica and Trinidad; Spondias; 2.3-2.5 mm
17. robustum (Schedl)

- Male declivity commencing well behind middle of elytra; female frons variously sculptured

19(18). Male declivity with a distinct, blunt tubercle near apex of interstriae 2; frons in both sexes with a moderate, transverse impression just above epistomal margin, a weak, short, median carina often present immediately above impression; declivital punctures usually obscure; female frons obscurely reticulate in central area above transverse groove, almost rugose-reticulate in groove; Puebla and Veracruz to Oaxaca; Alnus; 2.3-3.0 mm 18. hoegei (Blandford)

- Male declivity devoid of tubercle near apex of interstriae 2; frons feebly or not at all impressed above epistoma; declivital punctures usually distinctly impressed

20(19). Smaller; female frons rugose-reticulate from epistoma to upper level of eyes, reticulate above, male frons more coarsely punctured, rugose area slightly smaller, very obscurely reticulate above eyes; Puebla to Guatemala; Quercus; $2.3-2.6 \mathrm{~mm}$
19. luctuosum (Blandford)

- Larger; frontal sculpture different

21(20). Epistomal process not evident; frons rugose-reticulate on most of area below upper level of eyes, mostly shining in large central area above, punctures larger, numerous impressed points present; Puebla to Guatemala; Alnus; $2.9-3.2 \mathrm{~mm}$

- Epistomal process weakly elevated on about median sixth and apparently overlapping epistoma; frons rather strongly reticulate at epistoma, more weakly impressed toward vertex, punctures much finer, impressed points not evident; Costa Rica to Panama; Croton, Ochroma, Conostegia; 3.0-4.0 mm

21. consimile (Blandford)

22(16). Lateral margin of pronotum rounded, with no indication of a raised line; very small species

- Lateral margin of pronotum clearly marked by a fine, raised line; larger species

23(22). Declivity obliquely truncate in both sexes, margins rather abruptly angulate in
male, apex narrowly, shallowly emarginate; lateral margin of male declivity
armed on interstriae 3 by a small denticle and by a moderately large spine on
margin slightly above middle of declivity; female declivity with two tubercles
on basal half of interstriae 3; body bicolored

- Declivity rather broadly sulcate, lateral margins armed by two pairs of den
ticles of equal size, apex rather broadly, deeply emarginate; body unicolorous,
very slender

24(23). Male declivity steep, its basal margin obtusely angled, not precipitous or projecting, unarmed from suture to spine 1 , declivital face sparsely punctured, punctures on striae 1 widely spaced; female frons with median third conspicuously elevated, margins of elevation usually ornamented by long hair; female antennal club 1.4 times as long as wide, strongly tapered on distal half to subacute apex; Guatemala to Brazil; $1.4-1.8 \mathrm{~mm}$
22. egenum (Blandford)

- Male declivity more gradual, its basal margin precipitous or projecting slightly, armed by 1-3 small denticles between suture and spine 1 , face of declivity closely punctured, punctures on striae 1 very close; female frons without median elevation or vestiture, a conspicuous impression on dorsomedian margin of eye; female antennal club 1.0 times as long as wide, its apex very broadly rounded; Costa Rica to Colombia and Venezuela; $1.8-2.2 \mathrm{~mm}$

23. dimidiatum (Ferrari)

25(23). Larger; punctures on frons, pronotum, and elytra slightly more distinct; frons and elytra less strongly reticulate; Costa Rica to Panama; 1.6-1.9 mm
24. proprium Wood

- Smaller; punctures on frons, pronotum, and èlytra smaller, usually obscure; frons and pronotum more strongly reticulate; Nayarit and Veracruz to Colombia and Venezuela; 1.4-1.6 mm

25. pennatum (Schedl)

26(22). Female frons evenly convex, punctured, almost glabrous; declivity very steep,
occupying $20-25$ percent of elytral length .............................................................. 27

- Female frons variously impressed or elevated and ornamented by hair; declivity gradual, occupying more than 25 percent of elytral length; tropical distributions28

27(26). Elytral disc obscurely reticulate, punctures obsolete; declivital margins more strongly, more acutely elevated, lower dentical closer to lateral margin than to suture; "Mexico"; 1.7 mm
26. flohri (Schedl)

- Elytral dise strongly reticulate, strial punctures in rows, rather obscurely impressed; lateral margin less strongly elevated on lower half of declivity, lower denticle closer to suture than to lateral margin; California and Arizona to W Texas and Baja California; 1.8-2.2 mm

27. dentigerum (LeConte)

28(26). Female frons longitudinally divided into equal thirds by two shallow, parallel grooves from epistoma to upper level of eyes, each groove bearing a row of closely set, stout, short bristles, median third brightly shining, impunctate, remaining areas largely reticulate and with a few punctures or impressed points; male declivity steeper, broader; Costa Rica and Venezuela; 1.8-2.0 mm
28. bifoveatum Wood

[^24]29(28). Elytral disc normal, without a conspicuous impression or tubercles ........................ 30

- Elytral disc with a conspicuous impression commencing on basal fourth and extending toward declivity on interstriae 1 and 2 , each of these interstriae armed by a row of tubercles
$30(29)$. Female epistoma armed by a large, median, blunt horn, frons impressed on lower half, a conspicuous longitudinal, lateral impression above each eye, median area on vertex not pubescent; female antennal club elongate, almost twice as long as wide; male declivity broader, spine 1 at base much larger, closer to suture; Guatemala to Costa Rica, Venezuela; 3.0-3.4 mm ........ 29. lobatum (Ferrari)
- Female frons very strongly, transversely impressed just below upper level of eyes, vertex with a conspicuous tuft of long hair, other tufts of shorter hair on margins between level of antennal insertion and inner margin of eye; male declivity much narrower, spine 1 smaller than 2

31(30). Larger; area on female vertex giving rise to tuft of hair not impressed; female epistomal area not armed by a pair of lateral tubercles; Michoacán and Puebla to Venezuela; Quercus, Alnus, etc.; $2.6-3.1 \mathrm{~mm}$ 30. laterale (Eichhoff)

- Smaller; median area on female vertex (area giving rise to tuft of hair) distinctly impressed; female epistomal area bearing a pair of tubercles near bases of mandibles; Veracruz to Brazil; Spondias, Ficus, etc.; $2.0-2.4 \mathrm{~mm}$

31. fimbriaticorne (Blandford)

32(29). Discal sulcus conspicuous only on basal half of elytral disc, obsolete before declivity; female frons impunctate and glabrous on large triangular area, this area half as wide as frons at a point just above epistoma; Panama; 3.8-4.0 mm
32. sulcatum (Blandford)

- Discal sulcus continuous from basal fourth of dise to declivity; impunctate, glabrous area on female frons elongate, less than one-fourth as wide as frons at its widest point; Veracruz to Panama; 2.5 mm

33. ferrarii (Blandford)

33(15). Ventrolateral margin of male declivity acutely margined from apex to or toward level of lower declivital spine (are encompassing less than one-third of a complete circle, if sutural emargination ignored); sutural emargination usually acute, rather deep to obsolete

- Ventrolateral margin of male declivity acutely margined at least from level of upper spine to apex (arc more than two-thirds of a complete circle if sutural emargination ignored); sutural emargination broadly obtuse
34(33). Apex of declivital spine 2 closer to spine 1 than to declivital apex; distance between second declivital spines greater than between first spines (except in species from USA); lower margin of declivity transversely, more narrowly rounded35
- Apex of declivital spine 2 closer to elytral apex than to spine 1 ; distance between second declivital spines less than between first spines; lower margin of declivity transversely more broadly rounded
35(34). Declivity in both sexes weakly if at all impressed, spine 2 reduced, obsolete or not clearly identifiable; sutural apex entire to narrowly, rather shallowly emarginate 36
- Declivity more broadly, rather deeply excavated, spine 2 as large or larger than spine 1; emargination at sutural apex larger, deeper (except absent in desum)38

36(35). Larger; elytral apex at suture entire; declivital face weakly convex, armed by about four pairs of tubercles below spine 1 , their arrangement evidently indefinite; female frons shallowly concave from epistoma to vertex, median line distinctly, subacutely elevated, entire surface densely covered by fine, short hair; Nayarit; Quercus; 2.9-3.3 mm 34. bicavum Wood

- Smaller; elytral apex at least weakly emarginate at suture; declivital face without supplemental tubercles; female frons convex, subglabrous

37(36). Declivital spine 2 of reduced size; second declivital spines more closely spaced than first; declivital interstriae 1 unarmed by granules; frons reticulate; color light brown; Minnesota and Maine to E Texas and Florida, California; 1.8-2.4 mm 35. mali (Fitch)

- Declivital spine 2 obsolete; declivital interstriae 1 with a row of granules near middle (very fine in female); frons rugose-reticulate; color light brown except anterior half of pronotum and elytral declivity dark brown; Wisconsin and Massachusetts to Texas and Florida; 2.3-2.8 mm .......................... 36. fasciatum (Say)
38(35). Male declivital spine 2 much closer to suture than to lateral margin, much larger than 1, blunt; male declivity weakly impressed, distance between second declivital spines equal to that between first spines; Jalisco; 2.4 mm

37. tetradontium Wood

- Male elytral declivity more deeply sulcate, second spines much more widely spaced than first

39(38). Elytral surface shining, irregular impressed lines rather numerous, punctures distinctly impressed; male declivital spine 2 rather large, blunt; Jalisco to Nayarit; 3.1-3.6 mm
38. conversum Wood

- Elytral dise reticulate (at least on basal half), punctures on reticulate area small, obscure

40(39). Male elytral declivity occupying 40 percent of elytral length, gradual anterior to spine 1 and occupying as much longitudinal space as area below spine 1 ; posterior half of elytra brightly shining; Costa Rica; 1.4 mm

Male declivity steeper, occupying less than 30 percent of elytral length; elytral
disc and declivity reticulate; larger species ................................................................ 41
41(40). Male declivity more conspicuously extended beyond sutural apex, spine 1 remote from lateral margin, about one-third length of declivity from basal margin, small spine 2 at level of base of sutural emargination, spine 2 about equal distance between suture and lateral margin; Veracruz to Colombia and

- Male declivital spine 1 on lateral margin, spine 2 well above level of base of sutural emargination 42

42(41). Male declivity more narrowly, more deeply impressed, lateral margins more gradually rounded, interstriae 1 at base of declivity unarmed, spine 2 wider than high and pointed; frons with a fine, acutely elevated carina from epistoma to upper level of eyes; Costa Rica; $2.5-2.8 \mathrm{~mm}$

- Male declivity with small tubercle at base on interstriae 1 (except in desum), spine 2 larger; male declivity more broadly, more shallowly excavated, its margins more abruptly rounded; body often somewhat bicolored; frons devoid of a carina

43(42). Elytral apex not emarginate, declivity much steeper; minute tubercle absent on interstriae 1 at base of declivity; female declivity more strongly impressed, with second pair of spines more widely spaced than first pair; frons with a median tubercle near upper level of eyes; Chihuahua to Michoacán; Quercus; $1.8-2.1 \mathrm{~mm}$
42. desum (Wood)

- Elytral apex conspicuously emarginate, declivity not as steep, female with spacing of spines 1 and 2 about equal; frons without a median tubercle
44(43). Margins of male declivity abruptly rounded, spine 2 longer than its basal diameter; posterolateral margin of declivity acutely elevated from apex to level of spine 2; Costa Rica to Panama; 2.2-2.5 mm

43. punctifrons (Blandford)

- Margins of male declivity more gradually rounded, spine 2 shorter than its basal diameter; posterolateral margin of declivity acutely elevated only half of distance from its apex to level of spine 2; Costa Rica; Quercus; 2.8-3.4 mm

44. pseudoscutellare (Schedl)

45(34). Male declivity with a small, blunt tubercle at apex of interstriae 2, sutural emargination very shallow, broad, angle formed on declivital face between suture and subapical margin very slightly greater than 90 degrees, posterior margin lateral to suture extending only slightly beyond level of sutural apex; female frons with a strong transverse impression immediately above epistoma and with a conspicuous median tubercle immediately above impression (male of difficile unknown, female frontal characters not strongly developed)

- Male without a tubercle or callus at apex of declivital interstriae 2 (except present in insignatum), sutural emargination conspicuous, subapical margin conspicuously exceeding sutural apex in lateral area, angle formed on declivital face between suture and subapical margin much greater than 90 degrees; female frons sometimes with transverse groove or carina but never with both
46(45). Larger; transverse impression and median tubercle on female frons moderately to poorly developed, dorsolateral areas of frons smooth, shining, very coarsely punctured; (male unknown); Costa Rica to Panama; 2.8-3.1 mm 45. difficile (Blandford)
- Smaller; transverse impression on female frons abrupt, moderately deep, median tubercle rather well developed
47(45). Summit of lateral margin of male declivity at line extending between lateral margins of spines 1 and 2 ; female frons entirely devoid of median carina above median tubercle; Costa Rica; $2.4-2.6 \mathrm{~mm}$

46. insignatum Wood

- At least one-third of impressed area on male declivity lateral to line extending between spines 1 and 2; female frons protruding slightly toward median line, a distinct median carina extending from tubercle to upper level of eyes; Costa Rica; $2.0-2.3 \mathrm{~mm}$

47. fastigiorum Wood

48(45). Male declivital spine 2 laterally compressed, its apex bituberculate or emarginate, female frons very strongly, transversely impressed, impression occupying more than half of area between epistoma and upper level of eyes

- Male declivital spine 2 conical, pointed; female frons convex or if strongly, transversely impressed, impressed area confined to much less than one-fourth of area between epistoma and upper level of eyes, (except larger in female notatum)
49(47). Male elytral declivity slightly steeper, less broadly impressed; surface of male elytral disc reticulate from base to declivity; frons more finely punctured in both sexes; female frontal impression deepest on median third; Puebla; Alnus; $2.3-2.5 \mathrm{~mm}$

48. bidentatum Wood

- Male elytral declivity not as steep, more broadly impressed; male elytral disc reticulate on basal half, shining on posterior half; frons very coarsely punctured in both sexes; female frontal impression deepest on lateral thirds; Costa Rica to Panama; Conostegia; $2.7-2.8 \mathrm{~mm}$

49. bidens (Blandford)

50(48). Punctures on male declivital striae 1 distinctly impressed; frons with a distinctly, abruptly impressed transverse groove immediately above epistoma, rather weak in male, strongly developed in female; body usually bicolored

- Punctures on male declivital striae 1 obsolete or completely confused with other punctures; frons convex or very feebly impressed above epistoma in both sexes

51(50). Transverse frontal groove very deep in female, shallow but distinct in male, occupying lower half of area below upper level of eyes; male declivity more deeply impressed, with punctures on striae 1 very fine; Costa Rica to Panama; $2.2-2.5 \mathrm{~mm}$
50. notatum Wood

- Transverse frontal groove similar in both sexes, of uniform width, its width about equal to twice diameter of a facet of eye; male declivity less deeply impressed, with punctures on striae 1 coarse; Costa Rica to Panama; $2.6-3.0 \mathrm{~mm}$. 51. vittatum (Blandford)

52(50). Male declivity armed by two pairs of denticles, without a supplemental row of
granules

Male declivity on its upper half with a longitudinal row of granules just mesad
of spines 1 and 2 ; female frons without a carina ....................................................... 54
53(52). Male declivity commencing at middle of elytra; frons devoid of a median carina, rather coarsely punctured in female; Costa Rica; 2.2-2.6 mm; (see also 53. glabrifrons Blandford)
52. limulum Wood

- Male declivity normal, restricted to posterior fourth of elytral length; frons with a low median carina in both sexes; Costa Rica; 2.3-2.6 mm

54. carinulum Wood

54(52). Longitudinal row of granules on male declivity rather poorly developed, granules rather small, declivital sulcus between suture and granules less strongly impressed, surface rising gradually to granules; Honduras; $2.4-2.8 \mathrm{~mm}$ $\qquad$
.55. subgranulatum Wood

- Longitudinal row of granules on male declivity conspicuous, granules coarse, declivital sulcus between granules and suture more strongly impressed, surface rising precipitously to granules; Puebla to Oaxaca; $2.6-2.8 \mathrm{~mm}$

56. granulatum Bright

55(33). Declivital spine 2 entirely absent in both sexes, margin of sutural emargination strongly elevated perpendicular to declivital face, this elevation in male as high as its longest basal width; Costa Rica; 1.4 mm
57. infradentatum Wood

- Declivital spine 2 present in both sexes, margin of sutural emargination weakly if at all elevated 56

56(55). Declivital face finely punctured, subapical margin evenly curved from suture to lateral margin, area between spines more strongly impressed, including area anterior to spine 1; Costa Rica; $1.7-1.9 \mathrm{~mm}$
58. corculum Wood

- Declivital face more coarsely, shallowly punctured, elevated margin moderately to strongly angulate in posterolateral area, area between spines weakly impressed, and more strongly convex near suture anterior to spine 1 (these characters less evident in female)

57(56). Male declivity with posterolateral angles (formed by raised margin) rounded; Costa Rica; 1.7-2.1 mm
59. posticum Wood

- Male declivity with posterolateral angles abrupt; Costa Rica to Venezuela; $1.9-2.3 \mathrm{~mm}$

60. proximum Wood

## 1. Monarthrum dentatum (Eggers)

Amphicranus dentatus Eggers, 1931, Ent. Blätt. 27:19 (Holotype, male, Mineral del Chico, Hidalgo, Mexico; Berlin Mus.)
Diagnosis.- The true affinities of this species must remain in doubt until normal specimens are available; it should probably be placed somewhere between scutellare (LeConte) and quercicolens Wood.

Male.- Length $4.3 \mathrm{~mm}, 3.3$ times as long as wide; color reddish brown, basal twothirds of elytra yellowish brown.

Frons essentially as in scutellare. Pronotum 1.3 times as long as wide; posterior areas reticulate, punctures fine, sparse. Elytra 1.9 times as long as wide, 1.4 times as long as pronotum; discal surface with areas of obscure reticulation, smoother and with impressed points between areas of reticulation, with weak, irregular impressed lines, punctures almost obsolete, confused, small. Declivity intermediate between scutellare and quercicolens, spine 1 blunt, almost obsolete, 2 small, pointed; subspinose angle at upper limit of strongly elevated lateral margin at level of middle of declivity, lateral margin continued from this angle to sutural apex; floor of excavated area with a conspicuous, blunt denticle as high as wide at level of middle of declivity in line with discal interstriae 3 on right elytron only (abnormality?).

Distribution.- Hidalgo.
MEXICO: Hidalgo: Mineral del Chico, 23, Flohr.
Notes.- The above treatment was based on the holotype.

## 2. Monarthrum scutellare (LeConte)

Corthylus scutellaris LeConte, 1860, Pacific R.R. Expl. Surv. 9(1):59 (Holotype, female; San Jose, California; Mus. Comp. Zool., 2021)
Cryphalus cavus LeConte, 1868, Trans. Amer. Ent. Soc. 2:153 (Holotype, male; coast region south of San Francisco, California; Mus. Comp. Zool.); LeConte, 1876, Proc. Amer. Philos. Soc. 15:348. Synonymy
Pterocyclon obliquecaudatum Schedl, 1935, Rev. de Ent. 5:351 (Syntypes, female; California; Schedl Coll.); Wood, 1966, Great Basin Nat. 26:26. Synonymy

Diagnosis.- In this species the declivital suture is not emarginate, and the female declivity is broadly convex; in the male it is rather deeply excavated and armed on the basal margin by two pairs of denticles, and the frons is convex in both sexes, with inconspicuous vestiture.

Male.- Length 3.0-3.5 mm, 2.8 times as long as wide; color dark brown.

Frons very broadly convex, epistomal process low, its margin abrupt, procurved, occupying median two-thirds; surface rugosereticulate to upper level of eyes, smoother above, punctures moderately coarse, rather shallow; vestiture inconspicuous except for brush of hair arising from lower margin of epistomal process. Eye rather small, oval, almost one-third divided by emargination; finely faceted; emargination almost entirely filled by antennal socket. Antennal scape elongate; funicle 2 -segmented; club 1.17 times as long as scape, 1.3 times as long as wide; suture 1 and 2 weakly procurved.

Pronotum 1.2 times as long as wide; sides almost straight and parallel on basal half, weakly, arcuately converging, then very broadly rounded in front; anterior submargin armed by about 16 low serrations; indefinite summit one-third pronotum length from anterior margin; anterior slope steep, rather finely, closely asperate; posterior areas reticulate, finely, rather sparsely punctured. Glabrous except at margins.

Elytra 1.6 times as long as wide, 1.4 times as long as pronotum; sides almost straight and parallel on basal six-sevenths, rather abruptly rounded, feebly, broadly subemarginate behind; surface obscurely subreticulate, with minute lines and points usually present, punctures mostly connfused, fine, shallow. Declivity broadly, concavely excavated, rather steep; basal margin abruptly rounded, interstriae 1 usually armed by one or more small, pointed granules, 2 and 3 each armed by a small, pointed spine, lateral margins narrowly, strongly elevated to suture, an abrupt, subspinose angle on margin in line with
interstriae 4, rather strongly explanate below, most specimens entire at suture, a few narrowly cleft; floor of excavated area broad, mostly reticulate, punctures fine, rather close, confused, suture feebly elevated, unarmed. Vestiture largely confined to declivity, of abundant, long hair.

Female.- Similar to male except antennal club bearing a tuft of long hair on posterior face; serrations on anterior submargin of pronotum obsolete; elytral disc strongly reticulate; declivity flattened below, broadly convex above, margins rounded, not at all elevated, spines at base represented by small tubercles, interstriae 2 with a small blunt tubercle on 2 just above middle of declivity, posterior margin subacutely, weakly elevated.

Distribution.- British Columbia to Baja California.

CANADA: British Columbia: Duncan, Genoa Bay. USA: California: Alameda, Alum Rock St. Pk. in Santa Clara Co., Anaheim, Anderson Valley, Ben Lomond in Santa Cruz Co., Berkeley, Big Sur, Big Trees Grove in Mariposa Co., Brookwood in Santa Cruz Co., Callistoga, Camp Greeley in Fresno Co., Carmel, Fieldbrook, Lagunitas, Los Gatos, Marin Co., Menlo Park, Miami R.S., Mill Valley, Mt. Tamalpais, Muir Woods, Napa Co., Nojo River in Mendocino Co., Oakland, Palo Alto, Placerville, Pomona, Port Reyes, Santa Barbara, Santa Cruz Mts., San Mateo, Sequoia N.P., Shasta Co., Yorkville, Yosemite. Oregon: Ashland, Corvallis, Hood River. Washington: Seattle. MEXICO: Baja California: 6.5 km Arroyo Santo Tomás.

Hosts.- Chrysolepsis sp., Lithocarpus densiflorus, Quercus agrifolia, Q. kelloggii.

Biology.- Usually in logs larger than 15 cm in diameter.

Notes.- The above treatment was based on 261 specimens, including the type series of scutellare, cavus, and obliquecaudatum. The series from Baja California is smaller and exhibits minor differences in the antenna, female frons, and male elytra. Future collecting might make possible the recognition of subspecies based on these variations.

## 3. Monarthrum huachucae Wood

Monarthrum huachucae Wood, I959, Great Basin Nat. 19:61 (Holotype, male; Miller Canyon, Huachuca Mts., Arizona; U.S. Nat. Mus.)
Diagnosis.- This species is distinguished from scutellare (LeConte) by the more dorsal position of the angulate, subspinose upper
limits of the lateral margins of the elytral declivity, by the more slender body form, and by the abundant, long hair on the female frons.

Male.- Length 3.0-3.5 mm, 3.1 times as long as wide; color very dark brown.

Frons as in scutellare except epistomal process bearing a short, median, tuberculate carina. Pronotum 1.25 times as long as wide; as in scutellare.

Elytra 1.7 times as long as wide, 1.4 times as long as pronotum; essentially as in scutellare except discal punctures smaller, lateral margins of declivity higher and extending higher on declivity, distance between spines 1 and 2 almost equal to distance between 2 and subspinose upper angle of lateral margins; punctures on declivital face smaller; vestiture much less abundant, mostly shorter.

Female.- As in female scutellare except frons below upper level of eyes dull, very finely, densely punctured, and ornamented by abundant, long hair.

Distribution.-S Arizona.
USA: Arizona: Miller Canyon, Huachuca Mts., 29-VI07, H. A. Kaeber, 22-VIII-58 and 8-VIII-62, Qucrcus hypoleucoides, S. L. Wood; 4 miles or 6 km SW Forestdale, Navajo Co., 23-VIII-52, H. B. Leech. Oak Creek Canyon, V-78, M. W. Sanderson.

Biology.- Apparently as in scutellare.
Notes.- The above treatment was based on the type series of 4 specimens and on 26 other specimens.

## 4. Monarthrum quercus (Wood)

Fig. 217
Amphicranus quercus Wood, 1967, Great Basin Nat.
27:53 (Holotype, male; 3 miles or 5 km W El Salto, Durango, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from scutellare (LeConte) by the more slender form, by the profoundly explanate male declivity, by characters on the frons, and by other characters.

Male.- Length 4.4-4.6 mm (female $2.4-3.8 \mathrm{~mm}$ ), 3.4 times as long as wide; color dark brown.

Frons broadly, evenly convex, surface ru-gose-reticulate, rather coarsely punctured; epistomal process almost parallel to epistomal margin; vestiture largely limited to epistomal brush.

Pronotum 1.8 times as long as wide; sides straight and parallel on basal two-thirds,
broadly rounded to obtusely subangulate in front; anterior margin largely unarmed; much as in scutellare except for a subcircular area one-fifth as wide as pronotum and just anterior to summit impressed, devoid of asperities; its surface reticulate. Glabrous.

Elytra 2.1 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal nine-tenths, broadly rounded behind, deeply, narrowly emarginate at suture; disc much as in scutellare except not at all reticulate, shining. Declivity much as in scutellare except spine 1 at base blunt, displaced toward suture, lateral margins profoundly elevated and extended caudad, upper angle of margin forming a subquadrate tooth, very strongly explanate at narrowly, deeply emarginate suture; inner surface of excavated area subrugose-reticulate except shining and clearly punctured on lower half near suture. Vestiture confined to declivity, rather short except long on crest of elevated lateral margins.

Female.- Frons about as in male, otherwise about as in female scutellare except declivity broadly, shallowly concave, lateral margins on lower half slightly higher, and obtuse denticle on face of declivity larger.

Distribution.- Durango.
MEXICO: Durango: 5 km W El Salto, 7 -VI-65, 2500 m, No. 32, Quercus, S. L. Wood.

Biology.- Specimens were taken from logs and boles $50-100 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 46 specimens.

## 5. Monarthrum quercivorum Schedl

Monarthrum quercivorus Schedl, 1977, Zeitschr. Arb. Österr. Ent. 29:46 (Holotype, male; Metapán, El Salvador; Schedl Coll.)
Diagnosis.- This species is distinguished from the very closely allied querneum Wood by characters presented in the above key.

Male.- Length $3.0-3.7 \mathrm{~mm}, 3.2$ times as long as wide.

Very similar to querneus except as indicated in the above key. The female was not examined.

Distribution.- El Salvador.
EL SALVADOR: Metapán, 20-XII-74, 1600-2200 m, Qucrcus, H. Schmutzenhofer.

Notes. - The above treatment was based on a male, presumably the holotype, prior to its description.

## 6. Monarthrum querneum Wood Fig. 216

Monarthrum querneus Wood, 1967, Great Basin Nat. 27:50 (Holotype, male; 33 miles or 53 km E Morelia, Michoacán, Mexico; Wood Coll.)
Monarthrum bifidus Bright, 1972, Canadian Ent. 104:1381 (Holotype, male; 13 km or 8 miles E San Cristóbal de las Casas, Chiapas, Mexico; Canadian Nat. Coll.); Wood, 1973, Great Basin Nat. 33:179. Synonymy
Diagnosis.- This species is distinguished from quercicolens Wood by the smaller size, by the procurved margin of the male epistomal process, by the more restricted vestiture on the female frons, by the broader, deeper impression on the female vertex, and by differences on the elytral declivity.

Male.- Length 2.8-3.4 mm, 3.3 times as long as wide; color dark brown except basal half of pronotum and basal two-thirds of elytra, legs, and antennae yellowish brown.

Frons about as in scutellare except epistomal process less strongly elevated, less strongly procurved.

Pronotum 1.3 times as long as wide; about as in scutellare.

Elytra 1.8 times as long as wide, 1.4 times as long as pronotum; outline and disc about as in scutellare except surface smoother, lines and impressed points almost obsolete. Upper half of declivity very similar to scutellare except spines 1 and 2 slightly larger; strongly elevated lateral margins present on slightly less than middle third of declivity, ending abruptly, lateral margin continued to sutural apex at less than half height of middle third; floor of excavated area smooth, with rather coarse, close, deep punctures. Vestiture largely confined to declivity; long on lateral margins, shorter and less abundant in excavated area.

Female.- Frons similar to male except median third of epistomal brush of hair much more abundant and slightly more extensive; vertex concavely impressed on median area, impression twice as wide as long, its length equal to distance slightly less than width of antennal club; pronotum and elytra about as in female scutellare except declivity slightly more convex, with median sulcus on upper half slightly deeper.

Distribution.- Michoacán and Hidalgo to Honduras.

MEXICO: Chiapas: 13 km E and 6 km E San Cristóbal de las Casas, 6-VI-69, Qucrcus, D. E. Bright. Hidalgo: 30 km E Tulancingo, 12-VI-67, 2300 m, No. 15, Quercus, S. L. Wood. Michoacán: 53 km E Morelia, 14-VI-65, 3000 m , No. 5I, Quercus, S. L. Wood. HONDURAS: Zamorano. Morazán, 18-IV-64, 700 m , No. 516, Q. hondurensis, S. L. Wood.

Hosts.- Quercus hondurensis, Q. spp.
Biology. - Specimens were taken from logs $20-60 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 44 specimens of querneum, on the holotype and 2 paratypes of bifidus, and on 39 other specimens.

## 7. Monarthrum quercicolens Wood

 Fig. 216Monarthrum quercicolens Wood, 1967, Great Basin Nat. 27:49 (Holotype, male; 3.3 miles or 53 km E Morelia, Michoacán, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from querneum Wood by the larger size, by the straight margin of the male epistomal process, by the more abundant, more extensive female frontal vestiture, by the shallower, narrower impression on the female vertex, and by the declivity.

Male.- Length 3.7-4.3 mm, 3.1 times as long as wide; color dark brown, basal half of pronotum and basal half of elytra usually lighter.

Frons with margin of epistomal process straight, more abruptly elevated; other aspects as in querneum.

Pronotum and elytra as in querneum except strongly elevated portion of lateral margin slightly longer, its crest from dorsocaudal aspect longitudinally arcuate (almost straight in querneum); punctures on floor of excavated area more numerous; vestiture more abundant, longer.

Female.- Frons much as in female querneum except abundant vestiture continued on median fourth from epistoma to well above eyes, above eyes more broadly distributed over more than median half; impression on vertex rather shallow, heart-shaped, as wide as long, its width about two-thirds as great as width of antennal club; pronotum and elytra about as in female querneum.

Distribution.- Chihuahua and Hidalgo to Panama.

MESICO: Chihuahua: San Juanito, 4-V-77, Quercus, M. M. Furniss. Durango: 16 km W El Salto, VII-64, J. B. Thomas. Hidalgo: 30 km E Tulancingo, 12-VI-67, 2300 m , No. I5, Quercus, S. L. Wood. Michoacán: 9 km S Carapan, 18-Vi-65, 2300 m , No. 78, Quercus. S. L. Wood; 53 km E Morelia, 14-VI-65, 3000 m , No. 5I, Quercus, S. L. Wood. GUATEMALA: Panyachel, 20-VIII-65, P. J. Spangler, Tecpan, 8-VIII-67, O. S. Flint. PANAMA: Cerro Punta, Chiriquí, Il-I-64, 1800 m , No. 373. Qucrcus, S. L. Wood.

Fig. 216. Corthylini spp., declivities: I, Gnathotrichus dentatus; 2, Monarthrum quercicolens; 3, Monarthrum querneum; 4. Monarthrum bicavum; 5, Monarthrum desum. (After Wood 1967:46.)

Brology. - Specimens were taken from the same logs as querneum.

Notes.- The above treatment was based on the type series of 17 specimens and on 21 other specimens.

The Panama series has the frontal hair in the female more widely dispersed on the lower half. Although this could have subspecific significance, the recognition of subspecies is not warranted by the material at hand.

## 8. Monarthrum validum (Ferrari)

Corthylus calidus Ferrari, 1867, Die Forst- und Baumzuchtschädlichen Borkenkäfer, p. 55 (Lectotype, male; Mexico; Vienna Mus., designated by Wood, 1974, Great Basin Nat. 34:285)
Amphicranus mexicanus Eggers, 1931. Ent. Blätt. 27:18 (Holotype, male; Mexico; Berlin Mus.); Wood, 1974, Great Basin Nat. 34:285. Synonymy
Pterocyclon jalapac Schedl, 1939, Mitt. Münchn. Ent. Ges. 29:584 (Holotype, male; Jalapa, Veracruz, Mexico; Schedl Coll.); Wood, 1974, Great Basin Nat. 34:285. Synonymy
Diagnosis.- This species is distinguished from gnarum (Schedl) by the different male declivital armature, with almost obsolete declivital punctures, and by the deeper female excavation on the vertex, without a median carina on its floor.

Male.- Length $4.3-4.8 \mathrm{~mm}, 3.1$ times as long as wide; color dark brown.

Frons as in gnarum except median tubercle slightly closer to epistoma, granules smaller. Pronotum and elytral dise as in gnarum except punctures on both evidently from fine (as in gnarum) to very minute. Declivity as in gnarum except quadrate lateral elevation with lower third divided by a cleft from its upper two-thirds, thus forming an upper quadrate, and a lower, slightly longer, cylindrical, blunt spine; floor of excavation rugulose laterally, punctures much finer, almost obsolete, a few of them replaced by minute granules.

Female.- Similar to female of gnarum except excavated area on vertex at least twice as deep, its floor not at all divided by a median carinate partition.

Distribution.- "Mexico" and Costa Rica to Panama.

MEXICO: "Mexico, Flohr." COSTA RICA: Tapantí, Cartago, 2-VII-63, 1300 m , No. 6, Quercus, S. L. Wood. PaNAMA: Cerro Punta, Chiriquí, 11-1-64, 1800 m , No. 373, Quercus, S. L. Wood.

Biology.- Specimens were taken from logs $30-100 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on 26 specimens to which the types of validus, mexicanus, and jalapae had been directly compared. The male lectotype of validus has the punctures of the elytra very slightly larger than my series from Costa Rica and Panama; however, this character is rather variable within these series and probably does not have taxonomic significance.

## 9. Monarthrum praeruptum (Blandford)

Pterocyclon pracruptum Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):273 (Holotype, male; Totonicipan, Guatemala; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from gnarum (Schedl) by the less strongly excavated male elytral declivity, with the lateral margins less strongly elevated, with the ventrolateral margin less strongly explanate, and with the surface of the excavated area entirely reticulate.

Male.- Length 4.1 mm ; as in gnarum except as noted in diagnosis; in addition, minor spines at base of declivity smaller, lower angle of major spine more strongly acuminate.

Distribution.- Guatemala.
GUATEMALA: Totonicapan, $85-10,500 \mathrm{ft}, \mathrm{G} . \mathrm{C}$. Champion.

Notes.- The above treatment was based on the holotype.

## 10. Monarthrum gnarum (Schedl)

Pterocyclon gnarum Schedl, 1950, Dusenia 1:169 (Holotype, female; Mexico; Schedl Coll.)
Amphicranus spinatus Bright, 1972, Canadian Ent. 104:1383 (Holotype, male; 51 km or 32 miles $S$ Valle Nacional, Oaxaca, Mexico; Canadian Nat. Coll., 12655); Wood, 1974, Great Basin Nat. 34:285. Synonymy
Diagnosis.- This species is distinguished from quercicolens Wood by the brown color, by the frons in both sexes, by the less abundant elytral vestiture, and by the rather deep cleft between the quadrate process on the lateral margin and the ventrolateral margin of the declivity.

Male.- Length 4.2-4.7 mm, 3.1 times as long as wide; color brown.

Frons broadly convex, a distinct transverse impression between epistomal process and
median tubercle at upper level of eyes; epistomal process ascending slightly, distinctly procurved; surface rugose-reticulate below, smooth and shining above upper level of eyes; area below upper level of eyes with moderately coarse, rounded, isolated granules, rather coarsely punctured above. Aitennal club obovate, 1.7 times as long as wide.

Pronotum 1.2 times as long as wide; about as in scutellare except anterior margin more narrowly rounded, armed by about 10 coarser serrations; posterior areas obscurely reticulate (probably variable), punctures fine, distinct, moderately close.

Elytra about as in quercicolens except surface smoother, shining, base of declivity with fine, pointed teeth on interstriae 1,2 , and 3 , quadrate process higher than in quercicolens, separated from more strongly elevated ventrolateral process by an acute!y angulate (about 30 degrees) cleft; floor of excavated area smooth, shining, punctures very small, shallow. Vestiture very sparse, confined to sides and margins of declivity.

Female.- Frons elongate, weakly convex, smooth, closely, deeply, rather finely punctured, glabrous; vertex with a heart-shaped, rather deep excavation, about 1.7 times as long as wide, dorsal half of its floor marked by median carina; anterior margin of pronotum unarmed, posterior areas strongly reticulate; elytral disc strongly reticulate; declivity about as in female quercicolens except sutural and subapical impressions stronger, lateral areas armed by three to six scattered tubercles.

## Distribution.- Hidalgo to Chiapas.

MEXICO: Chiapas: San Cristóbal de las Casas, 26-V69, at light, D. E. Bright. Hidalgo: 30 km E Tulancingo, 12-VI-67, 2300 m , No. 15, Quercus, S. L. Wood. Oaxaca: 41 km S Juchatengo, 11, 27-30-V-71, at light. D. E. Bright. 59 km S Valle Nacional, 24-V-71, 2700 m , at light, D. E. Bright.

Biology.- One female was taken from a $\log 30 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotypes of gnarum and spinatus, on several paratypes of spinatus, and on one other female.

## 11. Monarthrum tomicoides (Blandford)

Pterocyclon tomicoides Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):273 (Lectotype, male; San Geronimo, Verapaz, Guatemala; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from conversum Wood by the broadly, weakly elevated epistomal process and by the male declivity.

Male.- Length $3.2-3.3 \mathrm{~mm}, 2.7$ times as long as wide; color black.

Frons, pronotum, and elytral dise as in conversum except epistomal process weakly, broadly elevated. Elytral declivity essentially as in conversum except slightly more broadly impressed, sutural emargination twice as wide; basal margin with a minute tubercle on interstriae 1 , a small pointed tooth on 2 , interstriae 3 armed by a large, conical, sharply pointed spine (equivalent of spine 1 in conversum), lower, lateral spine (equivalent to spine 2 in conversum) narrowly quadrate as in conversum but slightly longer and slightly shorter than spine at base on interstriae 3.

Distribution.- Guatemala.
GUATEMAlA: San Geronimo, Verapaz, G. C. Champion.

Notes.- The above treatment was based on the three male syntypes in the original series. The first of these was labeled as the type, but it has never been so designated. I here designate that specimen as the lectotype of tomicoides (Blandford).

## 12. Monarthrum bispinum (Blandford)

Pterocyclon bispinum Blandford, 1904, Biol. Centr. Amer. Coleopt. 4(6):281 (Holotype, male; Bugaba, Chiriquí. Panama: British Mus. Nat. Hist.)
Diagnosis.- This species apparently is allied to cordicticum Wood, from which it is distinguished by the presence of three pairs of spines on the basal half of the male declivity, by the absence of spines on the face of the male declivity, and by the shining, much more strongly impressed female declivity.

Male.- Length $2.6-2.8 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown to brown, anterior third of pronotum and elytral sides and declivity usually darker.

Frons broadly convex, a distinct, transverse impression immediately above slightly elevated epistomal margin; surface rugose-
reticulate, punctures rather abundant, moderately close, not sharply impressed; vestiture inconspicuous. Antennal club 1.7 times as long as wide, oval except narrowly rounded at both ends.

Pronotum 1.2 times as long as wide; sides almost straight and parallel on basal half, an indistinct, feeble constriction anteriorly, rather narrowly rounded in front; anterior margin armed by about $10-12$ broad, low serrations; indefinite summit one-third length from anterior margin; anterior slope rather coarsely asperate; posterior areas finely reticulate, minute, sparse, almost obsolete. Glabrous.

Elytra 1.5 times as long as wide, 1.2 times as long as pronotum; sides subparallel, feebly arcuate to apex, obtusely, rather deeply emarginate on more than median half behind; dise smooth, shining, strial punctures very minute, in rows. Declivity broadly, concavely excavated, outline an inverted heart shape; basal margin abruptly precipitous to suture, spines 1 and 2 conical, pointed, rather coarse, spine 3 in line with interstriae 4 , twice as long and twice as thick as 1 or 2 , cylindrical, pointed; posterolateral margin acutely, continuously elevated on an irregular are from base of spine 3 to suture; broadly, rather deeply emarginate at suture; concavity rather deep, deepest near feebly elevated suture, rising gradually to lateral margins; surface of concavity mostly smooth, shining, punctures moderately close and clearly impressed on median half only. Glabrous.

Female.- Similar to male except posterior face on antennal club not as slender, ornamented by long hair; anterior margin of pronotum very feebly serrate; margins of declivity not acutely elevated except on lower third, spines represented by pointed granules, 3 slightly displaced mesad; declivity, particularly upper half, rather strongly, concavely impressed, surface reticulate.

Distribution.- Costa Rica to Panama.
COSTA RICA: Rincón de Osa, Puntarenas, ll-VIII$66,30 \mathrm{~m}, \mathrm{No} .61, \mathrm{log}$, S. L. Wood. PANAMA: Bugaba, Chiriquí, 800-1500 ft, G. C. Champion.

Biology.- Specimens were cut from a yellowish $\log 30 \mathrm{~cm}$ in diameter.

Notes. - The above treatment was based on the holotype and on 20 other specimens.

## 13. Monarthrum terminatum (Blandford)

Pterocyclon terminatum Blandford, 1904; Biol. Centr. Amer., Coleopt. 4(6):280 (Holotype, male; Capetillo, Guatemala; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from cordatum (Blandford) and cordicticum Wood by the larger size and by the very different male declivity.

Male.- Length $2.7 \mathrm{~mm}, 3.0$ times as long as wide; as in cordicticum except declivity. Declivity steep, moderately excavated on basal half, basically almost flat below; basal margin armed as in cordicticum except spines slightly larger and stouter, lateral margins abruptly rounded, not strongly elevated except moderately elevated on lower half; a large, blunt, crescent-shaped elevation extending from middle of declivity on interstriae 3 to lower fourth of declivity near suture, its upper limits armed by a rather small, blunt tubercle; most surfaces smooth, shining. Vestiture confined to declivity, of moderately abundant, rather long hair.

Distribution.-Guatemala.
gUatemala: Capetillo, G. C. Champion.
Notes.- The above treatment was based on the holotype.

## 14. Monarthrum cordicticum Wood

Monarthrum cordicticum Wood, 1974, Great Basin Nat. 34:135 (Holotype, male; 30 km or 19 miles E Tulancingo, Hidalgo, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from cordatum (Blandford) in the male by the more gradual elytral declivity, by the less strongly, less abruptly elevated lateral margin of the declivity, by the larger, acutely pointed declivital spine 1 and smaller spine 2 . The female is indistinguishable from the female of cordatum.

Male.- Length $2.0-2.4 \mathrm{~mm}, 3.1$ times as long as wide; color yellowish brown except anterior half of pronotum and elytral declivity dark brown.

Frons and pronotum as in bispinum (Blandford).

Elytra 1.8 times as long as wide, 1.4 times as long as pronotum; sides straight and parallel almost to apex then broadly rounded, rather deeply, subacutely emarginate on median third behind; surface subreticulate except almost smooth near declivity, punctures
obscure. Declivity steep; concavely truncate; margin abrupt; spine 1 almost at suture, rather small, sharply pointed, 2 in line with striae 3 , twice as long as 1 , pointed, curved very slightly mesad, lateral margin from spine 2 to suture subacute, rather strongly elevated, descending gradually on its inner margin; rather deeply, subacutely emarginate at suture; excavated area rugose-reticulate, rather numerous, confused punctures on median third, a conical spine just below middle in line with discal interstriae 3, this denticle about as large as spine 1 . Subglabrous.

Female.- Similar to male except posterior face of antennal club without long hair; anterior margin of pronotum feebly serrate; declivity flat on lower half, more nearly convex and shallowly sulcate from suture to interstriae 2 above, small, pointed denticles on interstriae 3 at base' and also slightly above middle.

Distribution.- Puebla to Hidalgo.
MEXICO: Hidalgo and Puebla: 30 km E Tulancingo. on state line, I3-VII-67, 2300 m , No. 15, Quercus, S. L. Wood.

Brology.- Specimens were cut from a log 20 cm in diameter.

Notes.- The above treatment was based on the type series of 22 specimens. The female could not be distinguished from cordatum.

## 15. Monarthrum cordatum (Blandford)

Pterocyclon cordatum Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):279 (Holotype, female; Quiché Mts., Guatemala; British Mus. Nat. Hist.)
Diagnosis.- The male is distinguished from cordicticum Wood by the steeper declivity, by the reduced spine 1 and larger spine 2 on the declivity, and by the more abruptly, more strongly elevated lateral margin of the declivity.

Male. - Length $2.2-2.4 \mathrm{~mm}$; as in cordicticum except for elytral declivity. Declivity very steep; as in cordicticum except spine 1 blunt, almost obsolete, spine 2 longer and stouter, lateral margin abruptly elevated on inner margin, about as high as wide; face of declivity without distinct punctures on median third.

Female.- Indistinguishable from female cordicticum.

Distribution.- Guatemala to Panama.

GUATEMALA: Quiché Mts., G. C. Champion. PANAMA: Cerro Punta, Chiriquí, 11-I-64, 1800 m , No. 373, Quercus, S. L. Wood.

Host.- Quercus sp.
Biology. - Specimens were cut from a log 30 cm in diameter.

Notes. - The above treatment was based on one male and three females from Panama. The females were compared directly to the female holotype from Guatemala. These females are indistinguishable from the female of cordicticum. It was arbitrarily decided, in the absence of males from southern Mexico or Guatemala, that the Panama series was cordatum, because of similarity in the kind of habitat and of oak species. These species must be reexamined when more material is available for study.

## 16. Monarthrum nevernanni Schedl

Ptcrocyclon nevermanni Schedl, 1935, Rev. de Ent. 5:348 (Holotype, male; Kraterlagune, Vulkan Poas, Heredia, Costa Rica; Schedl Coll.)
Diagnosis.- This species is distinguished from allied forms by the subacutely elevated posterolateral margin of the male declivity, which is continued dorsad and meets spine 2 at its summit, and by the rather coarsely punctured frons, which has a rather definite median carina (poorly developed in the male).

Male.- Length $3.5-4.0 \mathrm{~mm}, 3.0$ times as long as wide; color brown.

Frons broadly convex, a feeble transverse impression just above epistoma; surface ru-gose-reticulate, punctures rather coarse, deep, moderately close, a low, broad, median carina from epistomal process to upper level of eyes; vestiture sparse, inconspicuous. Antennal club somewhat obovate, 1.4 times as long as wide.

Pronotum 1.15 times as long as wide; essentially as in scutellare (LeConte) except anterior margin more narrowly rounded and armed by about 10 serrations.

Elytra 1.7 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal two-thirds, then very slightly narrowed to apex, very broadly rounded and with a moderately deep $U$ shaped emargination on median third behind; surface reticulate; punctures minute, confused. Declivity rather steep; broadly,
concavely excavated; upper margin rounded, with broadly based, subacutely pointed, low spine 1 in line with striae 3 , spine 2 on margin in line with striae 5 , forming a subspinose, obtusely pointed angle on lateral margin, subacute lateral margin continuing from its summit to lateral margin of apical emargination; floor of excavated area ascending gradually from position of interstriae 2 to lateral summit, surface reticulate, punctures very fine, confused, rather abundant. Almost glabrous.

Female.- Similar to male except frontal carina more definite; antennal club subtriangular, as wide as long, its posterior face ornamented by long hair; anterior margin of pronotum unarmed; margins of declivity rounded, more nearly sulcate, spine 2 displaced mesad, similar to 1 .

Distribution.- Costa Rica.
COSTA RICA: Volcán Irazu, Cartago, 13-VII-63, 2300 m, No. 42, Quercus, S. L. Wood, Volcán Poás, Heredia, 14-VII-63, 2500 m , No. 46, Podocarpus oleifolius, 6-IX$63,1300 \mathrm{~m}$, No. I70, Clusia, S. L. Wood.

Hosts.-Clusia sp., Quercus spp., Podocarpus oleifolius.

Biology.- Specimens were cut from logs $20-120 \mathrm{~cm}$ in diameter.

Notes. - The above treatment was based on 51 specimens, 2 of which were compared directly to the holotype by me.

## 17. Monarthrum robustum (Schedl)

Pterocyclon robustum Schedl, 1966, Ent. Arb. Mus. Frey 17:123 (Holotype, female; Las Mercedes, Santa Clara district in Limón, Costa Rica; Schedl Coll.)
Diagnosis.- This species is distinguished from others in this species group by the male declivital sulcus, which begins slightly anterior to the middle of the elytra, by other details of the declivity, and by the complete absence of a median frontal elevation in either sex.

Male.- Length 2.3-2.5 mm, 2.5 times as long as wide; color dark brown.

Frons broadly convex, a weak transverse impression just above slightly elevated epistomal margin; surface rugose-reticulate from epistomal impression almost to upper level of eyes, at sides, and on vertex, central area almost smooth, punctures rather coarse, moderately close except sparse in central area; vestiture inconspicuous.

Pronotum 1.1 times as long as wide; outline as in nevermanni; indefinite summit at middie; anterior slope coarsely asperate, anterior margin armed by about eight serrations; posterior areas reticulate, punctures sparse, fine, some near base extended by short, transverse lines. Glabrous.

Elytra 1.3 times as long as wide, 1.2 times as long as pronotum; sides straight and parallel on basal half, weakly, arcuately converging, then very broadly rounded behind, rather shallowly emarginate on median onefifth; disc occupying basal half of elytral length; surface reticulate at base, shining near declivity, a few weak, irregular lines present, punctures very fine, confused toward base, mostly in rows toward declivity. Declivity commencing at or slightly anterior to middle, sulcate between interstriae 3 to level of spine 1 then more steeply, more broadly impressed; spine 1 on crest, moderately small, pointed, its anterior slope subcarinate; distance from base to spine 1 slightly greater than from spine 1 to apex; spine 3 slightly mesad of margin, distances to spine 1 and to apex about equal, conical, slightly larger than 1; posterolateral margin acutely, weakly elevated on a semicircular arc from sutural apex to a point at level of lower margin of spine 2; surface smooth, shining, punctures small, confused, moderately deep, rather abundant. Subglabrous.

Female.- Similar to male except frons less strongly convex; posterior face of antennal club ornamented by long hair; anterior margin of pronotum unarmed; elytral disc reticulate, declivity normal, sulcus anterior to spine 1 greatly reduced, declivital spines and impression slightly reduced.

## Distribution.- Costa Rica, Trinidad.

COSTA RICA: Las Mercedes, Santa Clara district in Limón, 13-VI-28, 100 m, F. Nevermann; Santa Ana, San José, 9-X-63, 1300 m , No. 228, Spondias purpurea, S. L. Wood. TRINIDAD: Morne Bleu, 8-VIII-69, $900 \mathrm{~m}, \mathrm{H}$. A. Howden.

Host.- Spondias purpurea.
Biology.- Specimens were cut from a recently cut limb 20 cm in diameter.

Notes. - The above treatment was based on the holotype and on 31 other specimens.

## 18. Monarthrum hoegei (Blandford)

Pterocyclon hoegei Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):274 (Holotype, Jalapa, Veracruz, Mexico; British Mus. Nat. Hist.)
Monarthrum oaxacaensis Bright, 1972, Canadian Ent. 104:1382 (Holotype, male: 32 miles or 51 km S Valle Nacional, Oaxaca, Mexico; Canadian Nat. Coll.)
Diagnosis.- This species is distinguished from others in this group by the presence of a small, blunt tubercle near the apex of male declivital interstriae 2 , by the small size, and by the subcarinate median crest on the female frons.

Male.- Length 2.3-3.0 mm, 2.7 (female 2.9) times as long as wide; color dark brown.

Frons as in robustu:n (Schedl) except transverse impression slightly stronger, a weak, median, subcarinate elevation indicated from epistoma to upper level of eyes.

Pronotum 1.16 times as long as wide; as in robustum except punctures very minute.

Elytra 1.5 times as long as wide, 1.3 times as long as pronotum; disc occupying basal two-thirds; sides straight and parallel on basal two-thirds, very shallowly, obtusely emarginate on median three-fourths behind; surface reticulate, punctures minute, partly in rows. Declivity very similar to female robustum but more deeply impressed (somewhat variable), spines conspicuously larger, surface subreticulate, punctures obsolete, a rather conspicuous, low, subtuberculate swelling near apex of interstriae 2. Subglabrous.

Female.-Similar to male except transverse impression above epistoma much deeper, median elevation above impression usually much higher (variable); posterior face of antennal club ornamented by long hair; anterior margin of pronotum more weakly serrate; declivity more narrowly impressed, spines smaller, tubercle near apex of interstriae 2 entirely absent.

Distribution.- Puebla and Veracruz to Oaxaca.

MEXICO: Oaxaca: 24 km and 51 km S Valle Nacional, 20-21-V-71, 1300 m , D. E. Bright. Puebla: 9 km NE Teziutlan, 27-VI-53, 2-VII-67, 1600 m , No. 135 in Alnus No. 137 in Miconia, S. L. Wood; Las Vigas, 5-V1l-67, No. 160, Alnus, S. L. Wood.

Hosts.-Alnus sp., Miconia sp.
Biology.- Specimens were cut from branches $4-6 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotype and 2 paratypes of oaxacaensis, and on 39 other specimens. The unique holotype of hoegei differs slightly from my Puebla series; additional material from Veracruz is needed to determine whether or not they actually are the same species.

## 19. Monarthrum luctuosum (Blandford)

Pterocyclon luctuosum Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):276 (Holotype, male; Cerro Zunil, Guatemala; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from robustum (Schedl) by the coarser, deeper punctures on pronotum and declivity, by the reticulate surface of the elytra, including the declivity, and by the shorter, normal male declivity.

Male.- Length 2.3-2.6 mm, 2.7 times as long as wide; color dark brown.

Frons and pronotum as in robustum except punctures on pronotal disc larger and deeper. Elytra as in robustum except disc occupying basal two-thirds, surface reticulate, punctures larger, deeper, confused; declivity about as in hoegei except surface reticulate, punctures on median half impressed, confused, rather abundant, and tubercle near apex of interstriae 2 entirely absent.

Female.- Similar to male except posterior face of antennal club ornamented by long hair; spines on elytral declivity slightly smaller, impression not as deep.

Distribution.- Puebla to Guatemala.
MEXICO: Puebla: 9 km NE Teziutlan, 2-Vll-67, 1600 m, No. 136 in tree bole, No. 152 in Quercus, S. L. Wood. GUATEMALA: Cerro Zuni, 4000 ft , G. C. Champion.

Host.- Quercus sp.
Biology.- Specimens were taken from small recently cut trees $8-15 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotype and on 20 other specimens.

## 20. Monarthrum umbrinum (Blandford)

Pterocyclon umbrinum Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):275 (Holotype, female; Purulá, Verapaz, Guatemala: British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from robustum (Schedl) by the larger size, by the less strongly impressed lines on the pronotal disc, and by the less extensive,
shallower sutural sulcus anterior to spine 1 on the male declivity.

Male.- Length $2.9-3.2 \mathrm{~mm}, 2.7$ times as long as wide; color dark brown.

Frons as in robustum except upper areas more brightly shining. Pronotum as in robust$u \mathrm{~m}$ except punctures on posterior areas slightly finer, transverse lines passing through those near base much finer, less extensive. Elytra as in robustum except declivity commencing slightly behind middle, disc about 55 percent of elytral length; sutural sulcus anterior to declivital spine 1 less extensive, about half as deep.
Female.-As in female robustum except frons less strongly convex.

Distribution.- Puebla to Guatemala.
MEXICO: Puebla: 9 km NE Teziutlan, 2-VII-67, 1600 m, Nos. 141 and 145 in Alnus, No. 154, tree limb, S. L. Wood. GUATEMALA: Purulá, Verapaz, G. C. Champion.

Host.-Alnus sp.
Biology.- Specimens were taken from recently cut material from $5-40 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotype and on 58 other specimens.

## 21. Monarthrum consimile (Blandford)

Pterocyclon consimile Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):275 (Holotype, female; Volcán de Chiriquí, Chiriquí, Panama; British Mus. Nat. Hist.)
Pterocyclon pseudosulcatum Schedl, 1935, Rev. de Ent. 5:348 (Holotype, male; Vara Blanca, Heredia, Costa Rica; Schedl Coll.); Wood, 1974, Great Ba$\sin$ Nat. 34:284. Synonymy
Diagnosis.- This species is distinguished from umbrinum (Blandford) by the larger average size, by the distinctive epistomal process, by the reticulate elytra, including the declivity, and by the absence of punctures on the declivity.

Male.- Length $3.0-4.0 \mathrm{~mm}, 2.6$ times as long as wide; color dark brown.

Frons similar to umbrinum except dull, mostly reticulate, punctures usually slightly smaller, epistomal process weakly elevated on median sixth and apparently overlapping epistoma, attaining margin.

Pronotum as in umbrinum except transverse lines absent.

Elytra as in umbrinum except entire surface, including declivity, reticulate, discal
punctures smaller, declivital punctures absent; sutural sulcus anterior to spine 1 not as deep, lower declivity more narrowly, more deeply sulcate.

Female.- Similar to male except posterior face of antennal club ornamented by long hair; anterior margin of pronotum more weakly serrate, more broadly rounded; declivital impression less extensive, not as deep, spines smaller.

Distribution.- Costa Rica to Panama.
COSTA RICA: 15 km SE Cartago, Cartago, 24-1X-63, 1800 m, No. 16, $\log$ S, L. Wood; Tapantí, Cartago, $24-$ X-63, 1300 m , No. $269, \log , \mathrm{~S} . \mathrm{L}$. Wood; Volcán Poás, Heredia, 14-Vll-63, 2500 m , No. 50, log, S. L. Wood. Panama: Cerro Punta, Chiriquí, 11-1-64, 1800 m , No. 426, Ochroma log, S. L. Wood; Volcán de Chiriquí, $25-4000 \mathrm{ft}, \mathrm{G} . \mathrm{C}$. Champion.

Hosts.- Ochroma sp., etc.
Biology. - Specimens were cut from logs $30-120 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotype of consimile, on 2 males compared to the holotype of pseudosulcatum, and on 66 other specimens. The type locality of pseudosulcatum is on the lower slopes of Volcán Poas.

## 22. Monarthrum egenum (Blandford)

Pterocyclon egenum Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):280 (Holotype, female; San Juan, Verapaz, Guatemala; British Mus. Nat. Hist.)
Brachyspartus bisetosus Schedl, 1954, Dusenia 5:38 (Syntypes, female; Río Caraguata, Matto Grosso, Brazil; Schedl Coll., etc.)
Diagnosis.- This species is distinguished by the small size, by the obliquely truncate male declivity that is armed by two pairs of spines, and by the peculiar female frons.

Male.- Length $1.4-1.8 \mathrm{~mm}, 2.9$ times as long as wide; color yellowish brown, anterior third of pronotum and elytral declivity very dark brown.

Frons broadly convex, with a weak transverse impression immediately above epistomal margin; surface rugose-reticulate from impression to upper level of eyes, smooth and shining above, punctures rather coarse, moderately close; vestiture of sparse, fine, inconspicuous hair. Antennal club oval, 1.37 times as long as wide; sutures straight, segment 3 distinctly longer.

Pronotum 1.27 times as long as wide; essentially as in scutellare (LeConte).

Elytra 1.4 times as long as wide, 1.2 times as long as pronotum; sides almost straight and parallel almost to sutural apex, then rather broadly rounded behind, narrowly, rather shallowly emarginate at suture; disc occupying basal two-thirds, its surface shining, almost Imooth, small strial punctures very obscurely indicated. Declivity abrupt, steep, shallowly, broadly concave; basal margin obtusely angled, not precipitous, a small, pointed spine on margin at interstriae 3; spine 2 on margin at middle of declivity, margin below spine 2 acute but not elevated; surface of excavated area smooth, shining, punctures on sutural row sparse, rather widely spaced, other punctures on upper half almost obsolete. Vestiture confined to declivity, moderately abundant, short except on margin.

Female.- Similar to male except frons with median third moderately elevated from epistomal margin to upper level of eyes, its lateral margins usually ornamented by a row of long hair directed orad, often absent, punctures almost obsolete; antennal club 1.4 times as long as wide, with suture 2 strongly arcuate on median half, distal half strongly tapered to subacute apex; without a tuft of long hair on posterior face; anterior margin of pronotum unarmed; elytral disc reticulate, punctures obscure to obsolete; lateral margins of declivity on upper two-thirds rounded; declivital spine 1 reduced to a tubercle on interstriae 3 slightly below upper margin, spine 2 a small tubercle similarly placed immediately below 1 .

Distribution.- Guatemala to Brazil.
guatemala: San Juan, Verapaz, G. C. Champion. COSTA RICA: Hamburgfarm on Río Reventazón, Limón, 13-111-25, Nevermann; Guápiles, Limón, $22-$ Vlil-66, 100 m, No. 109 , leguminous tree, S. L. Wood; Pandora, Limón, 23-VIII-63, 50 m , No. 152, leguminous log. S. L. Wood. OTHER COUNTRIES: Colombia. Brazil.

Hosts.- Leguminous trees.
Biology.- Specimens were cut from logs $20-50 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotype of egenum, on 2 female syntypes of bisetosus, and on 37 other specimens.

## 23. Monarthrum dimidiatum (Ferrari)

Corthylus dimidiatus Ferrari, 1867, die Forst- und Baumzuchtschädlichen Borkenkäfer, p. 57 (Syntypes; Venezuela; Vienna Mus.)

Pterocyclon moritzi Schedl, 1939, Rev. de Ent. 10:727 (Holotype, male; locality not given; Schedl Coll.); Wood, 1979, Great Basin Nat. 39:135. Synonymy
Diagnosis.- Superficially very similar to egenum (Blandford) but distinguished by the slightly larger size, by the more gradual, more densely punctured male declivity, by the absence of a female frontal elevation, by the presence of a strong impression on the dorsomedian margin of the female eye, and by the very different female antennal club.

Male.- Length $1.8-2.2 \mathrm{~mm}, 2.9$ times as long as wide; color yellowish brown, anterior half of pronotum and posterior third of elytra very dark brown.

Frons, pronotum, and elytral dise as in egenum; antennal club 1.3 times as long as wide. Elytral disc occupying basal 60 percent of elytral length; declivity more gradual than in egenum, its basal margin precipitous, projecting slightly, with 1-3 pairs of minute denticles between suture and spine l; other features essentially as in egenum except floor of excavated area closely, rather deeply punctured, punctures on striae 1 in a row, very closely spaced.

Female.- Similar to female egenum except median frontal elevation absent, a conspicuous, small impression on dorsomedian margin of eye; antennal club as wide as long, its posterior face with a conspicuous tuft of long hair; spine 2 at middle of declivity, much more widely spaced from 1.

Distribution.- Costa Rica to Colombia and Venezuela.

COSTA RICA: Turrialba, Cartago, 20-VIII-66, in flight, S. L. Wood. PANAMA: Cerro Punta, Il-I-64, in flight, S. L. Wood. OTHER COUNTRIES: Colombia, Venezuela.

Notes.- The above treatment was based on the 2 male syntypes of dimidiatum, on the holotype of moritzi, and on 33 other specimens. Although the types of dimidiatum and moritzi are slightly different, the variability in the Venezuelan material in my collection clearly bridges the gap between these two forms.

## 24. Monarthrum proprium Wood

Monarthrum proprium Wood, 1974, Great Basin Nat. 34:136 (Holotype, male; Cerro Punta near Volcán Chiriquí, Panama; Wood Coll.)
Diagnosis.- This species is distinguished from dimidiatum (Ferrari) by the smaller
size, by the smoother, more brightly shining frons, by the more narrowly oval antennal club, and by the shorter, less strongly explanate elytral declivity.

Male.- Length $1.6-2.1 \mathrm{~mm}, 3.2$ times as long as wide; color yellowish brown to dark reddish brown.

Frons convex; lower area, sides, and vertex rugose-reticulate, large central area smooth, shining, punctures rather coarse, close; vestiture sparse, inconspicuous. Antennal club oval, 1.3 times as long as wide, sutures feebly procurved.

Pronotum 1.4 times as long as wide; sides almost straight and parallel on basal twothirds, rather broadly rounded in front; anterior margin armed by about 10 serrations; summit on anterior third; anterior slope very steep, rather finely asperate; posterior areas reticulate, punctures minute. Glabrous.

Elytra 1.8 times as long as wide, 1.4 times as long as pronotum; sides almost straight and parallel on basal half, very slightly converging to level of sutural apex, then broadly rounded, rather deeply, obtusely emarginate on median fourth behind; surface reticulate, punctures obscure. Declivity rather steep, rather shallowly, broadly concave; margins rounded except acute near apex and at margins of emargination; lateral margins with spine 1 one-third and spine 2 two-thirds of declivital length from base, both on inner margins of lateral margin, each moderately small, conical, pointed, subequal in size; excavated area rugose-reticulate, except smooth and shining on median third, punctures on shining area small, sparse. Subglabrous.

Female.- Similar to male except antennal club 1.0 times as long as wide, ornamented on posterior face by long hair; anterior margin of pronotum more finely serrate; elytral declivity slightly less strongly impressed, spines smaller.

Distribution.- Costa Rica to Panama.
COSTA RICA: 15 km SE Cartago, Cartago. 1800 m . 3-VII-63, No. 17B, tree limb, 24-1X-63, No. 249, log, S. L. Wood. Panama: Cerro Punta, Chiriquí, 11-1-64, 1800 m , Nos. 371 and 404, in Inga, No. 398 in a limb, S. L. Wood.

Hosts.-Inga sp.
Biology.- Specimens were cut from material $10-30 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 16 specimens.

## 25. Monarthrum pennatum (Schedl)

Pterocyclon pennatum Schedl, 1963, Ent. Arb. Mus. Frey 14:167 (Holotype, female; Cordoba, Veracruz, Mexico; Schedl Coll.)
Diagnosis.- This species is distinguished from proprium Wood by the smaller size, by the more strongly reticulate frons, and by the smaller, more obscure punctures on frons, pronotum, and elytra.

Male.- Length $1.4-1.6 \mathrm{~mm}, 3.4$ times as long as wide; color yellowish brown.

Frons as in proprium except entirely reticulate, punctures slightly smaller, less distinctly impressed.

Pronotum and elytra as in proprium except punctures on pronotum very slightly smaller; elytral disc largely smooth and shining on posterior half. Elytral declivity slightly steeper, more narrowly impressed, spines slightly smaller.

Female.- Differing from female proprium in same ways as males; declivity also less strongly impressed.

Distribution.- Nayarit and Veracruz to Colombia and Venezuela.

MESICO: Nayarit: 6 km W Tepic, 13-VII-65, 1000 m , No. 240, tree limb, S. L. Wood. Veracruz: Cordoba. GUatemala: Volcán Pacaya, I-VI-64, 1300 m , No. 671 in tree branch, No. 700 in Caldo de Frijol limbs, S. L. Wood. HONDURAS: La Ceiba, Atlántida, 20-V-49, at light, E. C. Becker. COSTA RICA: San Isidro del General, San José, 5-XII-63, 1000 m , No. 284, Miconia pubcscens, S. L. Wood; 15 km SE Cartago, Cartago, 24-IX$63,1800 \mathrm{~m}$, No. 249 , tree bole, S. L. Wood; Tapantí, Cartago, 2-VII-63, 1300 m , No. 10, Conostegia oerstediana, S. L. Wood; Turrialba, Cartago, 9-III-64, 700 m , No. 468, new fence post, S. L. Wood. OTHER COUNTRIES: Colombia, Venezuela.

Biology. - Specimens were taken from material $5-15 \mathrm{~cm}$ in diameter.

Notes. - The above treatment was based on 59 specimens, one of which was compared to the holotype.

## 26. Monarthrum flohri (Schedl)

Ptcrocyclon flohri Schedl, 1950, Dusenia 1:168 (Holotype, male; Mexico; Schedl Coll.)
Diagnosis.- This species is distinguished by the smaller size, by the more slender form, by the near absence of punctures and reticulation on the elytral disc, and by the elytral declivity.

Female.- Length $1.7 \mathrm{~mm}, 3.1$ times as long as wide; color yellowish brown.

Frons convex, moderately inflated on triangular area from median line at upper level of eyes to epistoma; surface reticulate except minutely, densely punctured on median half of lower half, punctured area ornamented by rather abundant, moderately long hair, glabrous on median line and on reticulate areas; a very small, rounded tubercle on median line slightly below upper level of eyes.

Pronotum 1.3 times as long as wide; as in dentigerum (LeConte) except anterior slope shorter, steeper.

Elytra 1.7 times as long as wide, 1.5 times as long as pronotum; outline and dise as in dertigerum except disc less distinctly reticulate and punctures almost obsolete. Declivity very steep, deeply concave; lateral margins strongly elevated, narrowly rounded from apex to interstriae 1 at base, armed on basal margin at interstriae 3 by a small, acutely pointed spine, two small granules on crest of margin at middle of declivity, lower spine on lower fourth, similar to spine 1 but displaced mesad from lateral margin about one-fourth distance from lateral margin to suture. Glabrous except for sparse hair on and near margins of declivity.

Distribution.- Mexico (area not specified).
MEXICO: "Mexico, sammlung Flohr."
Notes.- The above treatment was based on the unique female holotype. The designation of sex was reversed in the original description.

## 27. Monarthrum dentigerum (LeConte)

Cryphalus dentiger LeConte, 1868, Trans. Amer. Ent. Soc. 2:154 (Holotype, male; Middle California; Mus. Comp. Zool., 1011)
Diagnosis.- This species is distinguished from proprium Wood by the larger size, by the different frons, by the more strongly, more coarsely punctured elytral disc, and by the much steeper, less strongly explanate elytral declivity.

Male.- Length 1.8-2.2 mm, 3.0 times as long as wide; color reddish brown.

Frons strongly convex, epistomal process weakly elevated and armed by a small median tubercle at its margin; surface strongly rugose-reticulate, punctures obscure, evidently coarse, close.

Pronotum about as in proprium.
Elytra 1.7 times as long as wide, 1.3 times as long as pronotum; sides almost straight and parallel on basal two-thirds, very slightly arcuately converging to level of sutural apex, very broadly rounded behind, narrowly, rather shallowly emarginate at suture; surface shining, mostly obscurely reticulate, punctures fine, distinct, confused at base, in obscure rows toward declivity. Declivity similar to proprium but much steeper, lateral margins on upper half slightly higher; spine 2 at middle of declivity, acute ventrolateral margin much longer; excavated area reticulate above, rugose-reticualte below, fine punctures sparse; a very small denticle present near apex of interstriae 2 .

Female.- Similar to male except posterior face of antennal club ornamented by long hair; anterior margin of pronotum weakly serrate; declivital denticles smaller, denticle near apex of interstriae 2 usually obsolete; elytral disc reticulate.

Distribution.-S California and Baja California to S Arizona and W Texas.

USA: Arizona: Chiricahua Mts., 4-IX-62, J. N. Knull; Miller Canyon, Huachuca Mits., H. A. Kaeber; Patagonia Mts., Santa Cruz, 2-V111-52, H. B. Leech. California: Palo Alto, 22-1I-17. Quereus agrifolia; Pasadena; Pomona; San Diego; San Mateo; St. Helena. Texas: Davis Mits., 24-V1-56, J. N. Knull. MEXICO: Baja California: Arroyo Santo Tomás, 30-XI-57, E. L. Sleeper.

Hosts.- Quercus agrifolia, Q. spp.
Biology.- Specimens were taken from large limbs and boles.

Notes. - The above treatment was based on the holotype and on 39 other specimens.

## 28. Monarthrum bifoveatum Wood

Monarthrum bifoceatum Wood, 1974, Great Basin Nat. 34:137 (Holotype, female: San José, San José, Costa Rica; Wood Coll.)
Diagnosis.- This species is rather similar, in the male, to proprium Wood except for the frons that is as in dentigerum (LeConte); the female frons is radically different and suggests a relationship to fimbriacorne (Blandford).

Male.- Length $1.8-2.0 \mathrm{~mm}, 3.0$ times as long as wide; color light brown, anterior half of pronotum and posterior third of declivity often darker.

Frons about as in dentigerum except reticulation and punctures finer. Pronotum,
elytral outline, and sculpture of elytral disc about as in dentigerum except elytral disc entirely reticulate, punctures much finer, rather obscure. Elytral declivity very similar to proprium except much less strongly explanate, emargination at suture much narrower, not as deep, floor of excavated area slightly wider.

Female. - Similar to male except frons divided into thirds by two shallow, parallel grooves from epistomal margin to upper level of eyes, each groove with a row of short, stout bristles, median third smooth, shining, lateral thirds mostly reticulate, with lower area at inner margin of eye rather strongly, subfoveately impressed; a few setae along epistomal margin; posterior face of antennal club ornamented by long hair; anterior margin of pronotum unarmed; elytral declivity less strongly impressed, much as in female proprium.

Distribution.- Costa Rica and Venezuela.

COSTA RICA: Escasú, San José, 2-X-63, 1300 m, No. 216, Spondias purpurea, S. L. Wood; San José, San Josẃ, 22-X-63, 1300 m , No. 187, broken limb, S. L. Wood. OTHER COUNTRIES: Venezuela.

Biology.- Specimens were taken from recently cut or broken limbs $10-20 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 43 specimens.

## 29. Monarthrum lobatum (Ferrari)

Corthylus lobatus Ferrari, 1867, Die Forst- und Baumzuchtschädlichen Borkenkäfer, p. 57 (Holotype, female; Venezuela; Vienna Mus.)
Diagnosis.- This unique species is most easily recognized by the oddly impressed female frons that has a large, conspicuous median process arising from the epistoma; the male declivity is deeply excavated and of unusual sculpture.

Male.- Length $3.0-3.4 \mathrm{~mm}, 3.0$ times as long as wide; color light to median brown, anterior half of pronotum and posterior third of elytra usually dark brown.

Frons convex, a moderately strong, transverse impression immediately above epistoma except interrupted at median line by a short, blunt carina; surface smooth in large central area, reticulate near epistoma, at sides, and above, punctures rather coarse, close, deep, except sparse near center.

Antennal club 1.8 times as long as wide; sutures weakly procurved.

Pronotum 1.3 times as long as wide; essentially as in scutellare (LeConte).

Elytra 1.7 times as long as wide, 1.4 times as long as pronotum; sides straight and parallel on basal two-thirds, then converging very slightly to level of sutural apex, broadly rounded, broadly, rather shallowly emarginate on median third; reticulate near base, posterior two-thirds smooth, shining, punctures minute, confused. Declivity rather steep, broadly, rather deeply excavated, basal margin projecting; spine 1 on interstriae 2 , its median basal margin three to four times longer than its lateral margin, extending almost to suture; spine 2 very small but with a very broad, subacutely elevated base extending almost to middle of declivity on lateral margin; posterolateral margin acute, rather weakly explanate, extending from suture to subtuberculate, obtuse angle on lateral margin about two-thirds of declivital length from base; surface of excavated area almost smooth, shining, punctures on median twothirds moderately coarse, close, deep, punctures sparse in lateral areas. Glabrous except for a few bristles on margins of declivity.

Female.- Similar to male except frons strongly, irregularly impressed from epistoma to vertex, a strong transverse impression on lower third, strong impressions in lateral area above eye; epistoma armed by a stout, median horn (angle at which it arises variable); median area ornamented by two rows of long setae from deep transverse groove to a point well above eyes where they converge; antennal club ornamented on posterior face by long hair; anterior margin of pronotum unarmed but ornamented by abundant, short, fine hair; lateral margins of declivity less strongly elevated, subtuberculate elevated angle replaced by a pointed tubercle.

Distribution.- Guatemala to Venezuela.
Guatemala: Purulá, G. C. Champion. COSTA RICA: San José, San José, 4-VIII-63, 1300 m , No. I66, Spondias purpurea, S. L. Wood. OTHER COUNTRIES: Venezuela.

Hosts.- Clusia sp., Nectandra sp., Spondias purpurea, etc.

Biology.- Specimens were cut from logs $20-80 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the one remaining male in Ferrari's
collection that is regarded as the holotype, on one Guatemalan, on one Costa Rican, and on 82 Venezuelan specimens.

## 30. Monarthrum laterale (Eichhoff)

Pterocyclon laterale Eichhoff, 1869, Berliner Ent. Zeitschr. 12:278 (Holotype, male; Mexico; lost with Hamburg Mus.); Wood, 1966, Great Basin Nat. 26:25 (Neotype, male; Toxpam, Mexico; British Mus. Nat. Hist., designated by Wood, 1966, Great Basin Nat. 26:25-26)
Cosmocorinus trifasciatus Schedl, 1950, Dusenia 1:173 (Holotype, female; Mexico; Schedl Coll.); Wood, 1966, Great Basin Nat. 26:25. Synonymy
Diagnosis.- The female is distinguished from other species in the genus, except fimbriaticorne (Blandford), by the strongly flattened antennal scape, by the triangular antennal club that is wider than long, and by the very elaborately sculptured and ornamented frons; the male is similar to the male of bifoveatum except that the elytral declivity is much more gradual and more deeply impressed. See also the diagnosis of fimbriaticorne.

Male.- Length 2.6-3.1 mm, 3.0 times as long as wide; color light brown, usually with anterior half of pronotum and posterior third or more of elytra dark brown.

Frons broadly convex, a weak, transverse impression on lower third, epistomal margin weakly elevated, epistomal process weakly elevated on median fourth; surface rugosereticulate below upper level of eyes, smooth and shining above, punctures rather coarse, moderately close; vestiture confined to epistomal area. Antennal scape slender, club oval, 1.2 times as long as wide.

Pronotum 1.3 times as long as wide; as in lobatum (Ferrari).

Elytra 1.7 times as long as wide, 1.5 times as long as pronotum; sides straight and parallel on less than basal half, gradually tapered to 60 percent of basal width at level of sutural apex; disc occupying basal 60 percent of elytral length; surface reticulate except shining near declivity, punctures minute, confused, rather abundant. Declivity rather gradual, rather broadly, concavely, excavated, concave area elongate; spines small, pointed, conical, spine 1 on interstriae 2 , spine 2 on interstriae 3, spine 3 on inner face of lateral margin on lower third, a small granule on margin at middle of declivity; posterolateral
margin acutely elevated from suture to lateral margin well below spine 3; surface of concave area smooth, shining, punctures moderately small, rather close, confused. Subglabrous.

Female.- Similar to male except frons profoundly, transversely impressed on procurved arc commencing on dorsomedian margin of eye, an extension of this impression extending from this arc along median line almost to epistoma, epistoma armed by a median tubercle; lateral areas on lower half irregularly elevated and ornamented by two separate tufts of long hair; median area of vertex ornamentd by a very long tuft of hair. Antennal scape strongly flattened distally, 1.4 times as long as wide; antennal club subtriangular, 1.5 times as wide as long, most of distal margin straight and ornamented by a row of very long hair; anterior margin of pronotum feebly serrate; elytral declivity shorter, steeper, less deeply excavated, denticles smaller, surface strongly reticulate.

Distribution.- Michoacán and Puebla to Venezuela.
MEXICO: Michoacán: 5.3 km E Morelia, 7-VI-65, 3000 m , Nò. 51 , Quercus, S. L. Wood. Puebla: 9 km NE Teziutlan, 2-VII-67, 1600 m , Nos. 141, 145 in Alnus, No. 146, tree limb, S. L. Wood. COSTA RICA: Tapantí, Cartago, 24-X-6.3, 1300 m , No. 269, $\log$, S. L. Wood. VENEZUELA: Rancho Grande, Pittier N.P., Aragua.

Hosts.-Alnus sp., Quercus sp., etc.
Biology.- Specimens were cut from logs $25-65 \mathrm{~cm}$ in diameter.

Notes.-- This species and fimbriaticome are the only species from Mexico fitting the description of laterale; the size was given in 1869 as 1 lin $(=2.12 \mathrm{~mm})$ but as 3 mm in 1878; the minimum size of laterale specimens before me is 2.6 mm . In naming other species in the 1869 paper, the size of most appears to be underestimated by $0.3-0.5 \mathrm{~mm}$; therefore, if this margin of error is applied to this species, it brings Eichhoff's specimen within the known size limits of laterale and suggests that the 1878 size is the most nearly correct of these two figures. Because the Eichhoff type was destroyed with the Hamburg Museum, the first male specimen in the Blandford series was designated as the neotype of this species to fix the identity of the name Pterocyclon (Wood 1966). The neotype of
laterale, the female holotype of trifasciatus, and 71 other specimens were examined.

## 31. Monarthrum fimbriaticorne (Blandford)

Pterocyclon fimbriaticorne Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):285 (Holotype, female; Purula, Alta Verapaz, Guatemala; British Mus. Nat. Hist.)
Pterocyclon turbinatum Schedl, 1961, Pan-Pacific Ent. 37:230 (Holotype, male; Cordoba, Veracruz, Mexico; California Acad. Sci.)
Diagnosis.- This species is distinguished from laterale (Blandford) by the smaller size, by the presence of a pair of epistomal tubercles near the bases of the mandibles in the female, by the impressed area on the female vertex from which the median tuft of hair arises, and, usually, in the male, by the more numerous, minute, impressed points on the frons and elytral declivity.

Male.- Length 2.0-2.4 mm, 3.0 times as long as wide; as in laterale except minute impressed points on frons and elytral declivity usually much more abundant.

Female.- Similar in all respects to female laterale except epistoma with a pair of tubercles at bases of mandibles and vertex slightly impressed on median area where tuft of hair arises.

Distribution.- Veracruz to Brazil.
MExico: Veracruz: Cordoba, A. Fenyes. Guatemala: Purula, Alta Verapaz, G. C. Champion. COSTA RICA: San Pedro de Monte de Oca, San José, 7-II-33. Parkinsonia aculeata, C. H. Ballou; San José, San José, 4-VIII-63, 1300 m . No. I08. Erythrina costaricensis. $4-\mathrm{X}-$ 63, No. 188, Spondias purpurea, S. L. Wood; Escasú, San José, 2-X-63, 1300 m, No. 2I8, tree sapling, S. L. Wood; Turrialha, Cartago, 7-I-62, Theobroma cacao, J. S. Saunders. OTHER COUNTRIES: Venezuela, Brazil.

Hosts.- Erythrina costaricensis, Parkinsonia aculeata, Spondias purpurea, Theobroma cacao.

Biology.- Specimens were cut from material $10-30 \mathrm{~cm}$ in diameter.

Notes. - The above treatment was based on the holotypes of fimbriaticorne and turbinatum and on 111 other specimens.

## 32. Monarthrum sulcatum (Blandford)

Pterocyclon sulcatum Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):284 (Holotype, male; Volcán de Chiriquí; British Mus. Nat. Hist.)
Diagnosis.- This species and ferrarii (Blandford) have a conspicuously impressed sutural sulcus that commences on the basal
fourth of the elytral length and continues toward the declivity. This species differs from ferrarii by the larger size, by the sutural sulcus that becomes obsolete before reaching the declivity, and by the female frons.

Male.- Length 3.8-4.0 mm, 2.9 times as long as wide; color light brown, anterior half of pronotum, elytral declivity, and sutural sulcus darker.

Frons broadly concave, a shallow, transverse impression above epistoma, margin of epistomal process armed by a low, subcarinate, median tubercle; surface reticulate near epistoma and sides, smooth and shining in central area and above, punctures rather coarse, moderately close; vestiture confined to epistomal area. Antennal club somewhat obovate, 1.7 times as long as wide.

Pronotum 1.2 times as long as wide; essentially as in scutellare.

Elytra 1.7 times as long as wide, 1.4 times as long as pronotum; sides straight and parallel on basal two-thirds, then moderately tapered to level of sutural apex, very broadly rounded behind except rather deeply emarginate on median one-fifth; disc occupying basal two-thirds, interstriae 1 and 2 rather abruptly impressed one-fourth of discal length from base, sulcus gradually becoming obsolete before declivity; general discal area subreticulate, punctures fine, shallow, confused, surface of sulcus finely rugose-reticulate and with fine, sparse tubercles mostly on interstriae 1. Declivity rather steep, broadly, shallowly concave; lateral margin rounded on basal third, more strongly, narrowly rounded on middle third, acutely, rather weakly elevated on lower fourth; spine 1 on interstriae 2 very small, pointed, 2 on interstriae 3 slightly larger than 1, pointed, 3 on mesal side of margin just below middle of declivity; resembling female lobatum except at basal margin. A few setae on or near margin of declivity.

Female.- Similar to male except lateral thirds of frons each with a concave impression on middle third, central area with a large, smooth, shining triangular area extending from near bases of mandibles to median point on vertex, upper half of its lateral margins ornamented by a row of very long hair, lower half may bear short hair, epistomal
area with abundant, rather short hair; antennal club more subtriangular, 1.1 times as long as wide, its posterior face and apical margin ornamented by long hair; anterior margin of pronotum unarmed; elytral declivity convex on upper two-thirds and narrowly sulcate, flattened below, spines 2 and 3 represented by small tubercles on interstriae 3, lateral margin rounded, indefinite.

Distribution.- Panama.
PaNama: Volcán de Chiriquí, G. C. Champion: Cerro Punta near Volcán de Chiriquí, 11-1-64, 1800 m . No. 373, Quercus, S. L. Wood.

Brology.- Specimens were cut from a log 20 cm in diameter.

Notes.- The above treatment was based on the holotype and on two other specimens compared to it.

## 33. Monarthrum ferrarii (Blandford)

Pterocyelon ferrarii Blandford, 1905. Biol. Centr. Amer., Coleopt. 4(6):284 (Holotype, female; Volcán de Chiriquí, Panama: British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from sulcatum (Blandford) by the smaller size, by the different female frons, by the deeper discal sulcus on the elytra, and by the less strongly excavated elytral declivity.

Male.- Length 2.4-2.5 mm, 2.5 times as long as wide; color dark brown, basal halves of pronotum and elytra usually lighter.

Frons as in sulcatum except surface below upper level of eyes rugose-reticulate. Antennal club 1.4 times as long as wide.

Pronotum 1.16 times as long as wide; as in sulcatum.

Elytra 1.5 times as long as wide, 1.3 times as long as pronotum; basically as in sulcatum except surface reticulate only near base, discal sulcus conspicuously deeper and continued to declivity, its basal margin on interstriae 1 armed by a small, subdentate process, its lateral margin armed by a sparse row of rather coarse granules; declivity similar to sulcatum but less strongly impressed, margins rounded, spines 1 and 2 conical, mesad of margin.

Female.- Similar to female sulcatum except smooth, shining area on frons confined to median fourth, oval, extending from epistoma to upper level of eyes, long hair around its margins much more abundant, only slightly longer at vertex; antennal club similar but less strongly modified; disca! sulcus on elytra similar to male except not as deep, denticles and granules smaller.

Distribution. - Veracruz and Panama.
MESICO: Veracruz: Lago Catemaco, 16-20-V-69, D. E. Bright. PANAMA: Volcán de Chiriquí, G. C. Champion.

Notes.- The above treatment was based on two specimens; the holotype had been examined prior to their collection.

Fig. 217. Corthylini spp., declivities: 6-7, Monarthrum quercum; 8, Amphicranus rameus; 9, Corthylus petilus. (After Wood 1967:54.)

## 34. Monarthrum bicavum Wood

 Fig. 216Monarthrum bicavum Wood, 1967, Great Basin Nat. 27:51 (Holotype, female; Laguna Santa María, Nayarit, Mexico; Wood Coll.)
Diagnosis.- This species is unique in the genus. The female frons is shallowly biconcave and finely pubescent from epistoma to vertex and the declivity in both sexes is broadly convex, with the sutural apex entire.

Male.- Length 2.9-3.3 mm, 3.0 times as long as wide; color very dark brown.

Frons broadly convex, shallowly, transversely impressed above epistoma; a low, obtuse, median carina from impressed area to well above eyes; surface rugose-reticulate from epistoma to well above eyes, smooth and shining on vertex, punctures rather coarse, close. Antennal club 1.5 times as long as wide.

Pronotum 1.2 times as long as wide; about as in scutellare except anterior slope less strongly declivous, anterior margin more weakly serrate.

Elytra 1.7 times as long as wide, 1.4 times as long as pronotum; dise occupying basal two-thirds; strial punctures moderately coarse, deep, in rows on posterior third, surface almost smooth, with moderately abundant, fine, impressed points. Declivity rather abrupt, steep, subsulcate on basal third, feebly convex below; ventrolateral margin acute, not explanate, not at all emarginate at suture; small spines at base of interstriae 1 and 2 , three or four pairs of smaller, conical spines arranged on middle third of declivity in an approximate circle remote from lateral margin. Subglabrous.

Female.- Similar to male except epistomal area moderately produced, frons shallowly, broadly concave from epistoma to vertex, divided on median line by a carina; surface of concave area, including carina, minutely, densely punctured; vestiture of abundant, fine, erect, short hair; antennal club 1.4 times as long as wide, ornamented on posterior face by long hair; anterior slope of pronotum feebly declivous, anterior margin unarmed; lower two-thirds of elytral declivity with only one pair of tubercles on interstriae 3 near middle of declivity.

Distribution.- Nayarit.

MEXICO: Nayarit: Laguna Santa Maria, 6-VIl-65, 1000 m, No. 203, Quercus, S. L. Wood.

Biology.- Specimens were cut from an oak $\log 25 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 21 specimens.

## 35. Monarthrum mali (Fitch)

Fig. 211
Tomicus mali Fitch, 1855, Trans. New York St. Agric. Soc. 15:326 (Syntypes?; New York; not located) Ptcrocyclon longulum Eichhoff, 1869, Berliner Ent. Zeitschr. 12:278 (Syntypes?; Carolina; lost with Hamburg Mus.); LeConte, 1876, Proc. Amer. Philos. Soc. 15:349. Synonymy
Diagnosis.- In this species the male and female are very similar, and the declivity is flattened and armed by two pairs of small denticles, both of which are near the suture.

Male.- Length $1.8-2.4 \mathrm{~mm}, 3.2$ times as long as wide; color yellowish to light reddish brown.

Frons convex, reticulate, somewhat rugose toward epistoma; punctures moderately coarse, close; vestiture inconspicuous. Antennal club 1.5 times as long as wide.

Pronotum 1.3 times as long as wide; essentially as in scutellare.

Elytra 1.7 times as long as wide, 1.4 times as long as pronotum; sides straight and parallel on basal two-thirds, then converging slightly to level of sutural apex, broadly rounded behind and rather deeply emarginate on median fifth; disc occupying basal two-thirds, surface reticulate, punctures obscure, minute, strial punctures in rows near declivity. Declivity steep, rather narrowly sulcate on more than basal half, flattened below; armed by two pairs of small, usually blunt denticles on interstriae 2 , denticle 1 near base, 2 slightly below middle; ventrolateral margin acute, not explanate; surface reticulate. Subglabrous.

Female.- Similar to male except antennal club 1.2 times as long as wide, its posterior face ornamented by long hair; declivital sulcus slightly less strongly impressed.

Distribution.- British Columbia (?), California; Minnesota and Maine to E Texas and Florida.

CANADA: British Columbia (accidental or error in labeling?). USA: Alabama: Selma. Arkansas: Bradley Co. California: Felton in Santa Cruz Mts., Nacimiento Reservoir in San Luis Obispo. Connecticut: Samford. District of Columbia: Washington. Florida: Crescent City,

Enterprise, Gainesville, Orlando, Tampa, Royal Palm Hammock St. Pk., St. Johns Co. Illinois: Farina, Urbana. Indiana: Mitchell, Vincinnes. Iowa: Ames, Iowa City. Kentucky: Barbourville, Lebanon. Louisiana: Tallulah. Maine: Paris. Maryland: Baltimore, Bladensburg. Massachusetts: Boston, Petersham, W. Springfield. Michigan: Amn Harbor, Detroit, Grand Ledge, Marquette. Minnesota: Hennepin Co. Mississippi: Hancock Co., Holly Springs, Laurel, Nicholson, Poplarville, Vicksburg. New Jersey: Dundee Lake, Essex Co., Orange, Summit. New York: Axton, Catskill Mts., Central, Cranberry Lake, Elka Park, Ithaca, Lancaster, New Rochelle, New York, Pelham, Staten Island, West Point. North Carolina: Asheville, Black Mts., Boardman, Durham, Gray Beard Mt., Tryon. Ohio: Ada, Canfield, Cincinnati, Clinton Co., Columbus, Franklin Co., Gomer, Ira in Summit Co., Wooster. Pennsylvania; Castle Rock. Charter Oak, Frankford, Harrisburg, Johnsonburg, Landisburg, Philadelphia, Potsville. South Carolina: Jacksonboro, Myrtle Beach, Nichols. Tennessee: Gatlinburg, Oak Ridge. Texas: Kirbyville. Virginia: Blacksburg, Carter Bridge, Falls Church, Hawless, Penington Gap, Virginia Beach. West Virginia: Bayard, Dellslow, Monongaliala, Morgantown, Pickens, Raleigh Co., Taylor Co., Wayne Co., Wood Co. Wisconsin: Buffalo Co., Hartland, Plattville.
Hosts.- Acer rubrum, Betula lutea, Fagus americana, Liquidambar styraciflua, Nyassa sp., Quercus rubra, Tilia sp.

Biology.- Unthrifty, injured, or recently cut material larger than about 10 cm in diameter is selected for attack.

Notes. - The type was not located and probably is lost. I examined material in the LeConte collection and the U.S. National Museum, where specimens based on the Fitch material is located. There appears to be no problem in identifying this species in the absence of a type; 373 specimens were examined.

## 36. Monarthrum fasciatum (Say) Fig. 2II

Bostrichus fasciatus Say, 1826, J. Acad. Nat. Sci. Philadelphia 5:255 (Syntypes; Sinnipuxent, probably Pennsylvania; lost)
Pterocyclon simile Eichhoff, 1869, Berliner Ent. Zeitschr. 12:277 (Syntypes? America bor., lost with Hamburg Mus.); LeConte, 1876, Proc. Amer. Philos. Soc. 15:348. Synonymy
Pterocyclon gracile Eichhoff, 1878, preprint of Mém. Soc. Roy. Sci. Liége (2)8:444 (Syntypes; Tennessee, Pennsylvania, Carolina; lost with Hamburg Mus.): Eichhoff, 1878, preprint of Mém. Soc. Roy. Sci. Liége (2)8:444. Synonymy
Diagnosis.- This species is distinguished from mali (Fitch) by the larger size, by the bicolored coloration, and by the absence of declivital spine 2.

Male.- Length 2.3-2.8 mm, 3.2 times as long as wide; color yellowish brown, anterior half of prothorax and posterior third of elytra usually dark brown.

Head, pronotum, and elytral dise as in mali. Elytral declivity as in mali except sulcus limited to upper half, denticle 2 absent; sutural interstriae at middle of declivity armed by a rather indefinite row of four to six small granules; surface rugose-reticulate.

Female.- Similar to male except differing as female mali differs from male.

Distribution.- Wisconsin and Massachusetts to E Texas and Florida.

USA: Arkansas: Bradley Co., Huttig, Maynard, Randolph. Connecticut: Glastonburg, Stanford. District of Columbia: Brookland. Florida: Crescent City, Enterprise, Gainesville, Jacksonville, Orlando, Putnam Co. Georgia: Dunwoody, Thomasville. Illinois: Dubois, Macomb, Urbana. Indiana: Centralville, Ft. Wayne, Indianapolis, Mitchell, Vicennes. Iowa: Iowa City. Kansas: Benedict, Topeka. Kentucky: LeBanon Junction, Paducah. Louisiana: Tallulah. Maryland: Beltsville, Bladensburg, Chevy Chase. Massachusetts: Framingham. Michigan: Detroit, Grand Ledge, Port Huron. Mississippi: Agricultural College, Corinth, Meridian, Nicholson, Vicksburg. Missouri: St. Louis. New Jersey: Boonton, Orange, Paterson, Summit. New York: Buffalo, Flatbush, Ithaca, Jamaica, Mt. Vernon, Staten Island, West Point. North Carolina: Boardman, Charlotte, Raleigh, Tryon. Ohio: Cincinnati, Clinton Co., Columbus, Delaware Co., Franklin Co., Green Co., Hocking Co., Lakeside, Logan Co., Wooster. Pennsylvania: Frankford, Harrisburg, Inglenook, Johnsonburg, Philadelphia. South Carolina: Table Rock St. Pk. Tennessee: Memphis, Nashville. Texas: Brownsville. Virginia: Blacksburg, Hewlin, Onville. West Virginia: Dellslow, Taylor Co., Wood Co. Wisconsin: Madison.

Hosts.- Acer rubrum, Carya sp., Castanea dentata, Liquidambar styraciflua, Mimosa sp., Nyosa sp., Pinus sp., Prunus sp., Quercus alba, Q. digitata, Q. rubra, Q. spp.

Brology.- As in mali.
Notes.- The above treatment was based on the LeConte material that presumably was compared to Say's series.

## 37. Monarthrum tetradontium Wood

Monarthrum tetradontium Wood, 1974, Great Basin Nat. 34:137 (Holotype, male; SE Slope Mt. Colima, Jalisco. Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from exornatum (Schedl) by the smoother, much more deeply punctured elytral dise and by the larger, much stouter declivital spines.

Male.- Length $2.4 \mathrm{~mm}, 3.3$ times as long as wide; color dark brown, basal half of elytra slightly lighter.

Frons convex, reticulate, becoming rugosereticulate toward epistoma, punctures moderately coarse, close; vestiture inconspicuous.

Pronotum 1.4 times as long as wide; sides straight and parallel on basal two-thirds, broadly rounded in front; anterior margin subserrate; otherwise as in scutellare (LeConte).

Elytra 1.9 times as long as wide, 1.3 times as long as pronotum; sides straight and parallel on basal half, distinctly tapered on posterior half, rather narrowly rounded behind, deeply emarginate on median sixth; surface almost smooth, obscurely reticulate in some areas, punctures rather small, moderately deep, confused except strial and interstrial punctures almost in rows near declivity. Declivity rather steep, flattened, lateral margins rounded, not elevated, apex moderately explanate; interstriae 2 (actually displaced interstriae 3) armed one-third and two-thirds distance from base by spines; spine 1 conical, pointed, about as high as its basal width, spine 2 slightly higher, very stout, blunt; surface near base of spine 1 rugose-reticulate, remaining area almost smooth and deeply punctured. Vestiture sparse, confined to declivity.

Distribution.- Jalisco.
MEXICO: Jalisco: SE slope of Mt. Colima, 2-XII-48.
Notes.- The above treatment was based on the holotype.

## 38. Monarthrum conversum Wood

Monarthrum conversum Wood, 1974, Great Basin Nat. 34:138 (Holotype, male; 6 km or 4 miles W Tepic, Nayarit, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from exornatum (Schedl) by the larger, stouter size and by the very different elytral declivity. Also see tomicoides (Blandford), to which it is much more closely related.

Male.- Length 3.1-3.6 mm, 3.0 times as long as wide; color very dark reddish brown, basal half of pronotum lighter.

Frons essentially as in exornatum except upper area almost smooth and with minute, impressed points.

Pronotum 1.3 times as long as wide; sides straight and parallel on basal half, rather
narrowly rounded in front; anterior margin armed by about 10 coarse serrations; about as in scutellare (LeConte) except punctures on posterior areas slightly larger, those near base of disc transversely elongate. Glabrous.

Elytra 1.5 times as long as wide, 1.2 times as long as pronotum; outline about as exornatum except stouter; surface shining, with rather numerous fine, irregular lines, numerous impressed points, punctures rather small, moderately deep, confused. Declivity steep, broadly, concavely excavated; lateral margins moderately elevated, rounded except on apical fifth of declivital length; spine 1 on interstriae 3 at basal margin, as high as basal width, subconical; spine 2 two-thirds declivital length from base, displaced less than its basal width from margin, subcylindrical, very slightly longer than its basal width, its apex subtruncate, its dorsal angle subacute; excavated area mostly shining, with numerous minute, impressed points, punctures moderately coarse, rather deep, lateral areas near margins rugose-reticulate. Subglabrous.

Female.- Similar to male except antennal scape with fine, short hair; anterior margin of pronotum obscurely serrate; elytral disc reticulate, punctures somewhat obscure; declivity mostly broadly convex, moderately sulcate on upper half, subconcave below; spine 1 much smaller; spine 2 at middle of declivity midway between lateral margin and suture, of similar size and shape to spine 1 ; declivital surface rugose-reticulate, punctures small, obscure.

Distribution. - Nayarit to Jalisco.
MEXICO: Jalisco: Volcán Colima, 23-VI-65, 2500 m , in flight, S. L. Wood. Nayarit: 6 km W Tepic, 13-VII-65, 1000 m, No. 240 , tree limb, S. L. Wood.

Biology. - One pair was cut from a limb about 8 cm in diameter.

Notes.- The above treatment was based on the type series of three specimens.

## 39. Monarthrum morsum Wood

Monarthrum morsum Wood, I974, Great Basin Nat. 34:139 (Holc:ype, male; Pandora, Limón, Costa Rica: Wood Coll.)
Diagnosis.- This species is distinguished from exomatum (Schedl) by the smaller size and by the steeper, narrower elytral declivity with different sculpture and arrangement of spines.

Male.- Length $1.5 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown, posterior half of elytra darker.

Frons and pronotum as in exornatum except pronotum 1.15 times as long as wide.

Elytra 1.5 times as long as wide, 1.3 times as long as pronotum; outline as in conversum Wood except more strongly tapered on posterior third; disc obscurely reticulate on basal third, smooth and shining elsewhere, numerous impressed points present, punctures fine, distinct, in strial rows on posterior half. Declivity moderately steep, rather broadly, strongly sulcate; spine 1 on interstriae 2 near base, rather small, pointed, its upper margin feebly subcostate; spine 2 small, conical, twothirds declivital length from base, displaced from lateral margin one-third distance toward suture; feebly explanate below; surface of impressed area shining, numerous impressed points present, punctures evident only near suture. Vestiture confined to declivity, of short moderately abundant hair.

Distribution.- Costa Rica.
COSTA RICA: Pandora, Limón, 23-VIII-63. 50 m . No. 135, tree limb, S. L. Wood.

Biology. - The holotype was cut from a limb 8 cm in diameter.
Notes.- The above treatment was based on the holotype.

## 40. Monarthrum exornatum (Schedl)

Pterocyclon exornatum Schedl, 1939, Mitt. Münchn. Ent. Ges. 29:575 (Holotype, male; Colonia, apparently Mexico; Schedl Coll.)
Pterocyclon gracilicornum Schedl, 1939, Mitt. Münchn. Ent. Ges. 29:576 (Holotype, male; Jalapa, Veracruz, Mexico; Schedl Coll.); Wood, 1966, Great Basin Nat. 26:25. Synonymy
Diagnosis.- This species is distinguished from tetradontium Wood by the smailer size, by the more deeply impressed elytral declivity, with a much different arrangement of spines, and by the reticulate elytral surfaces, with the punctures obscure to obsolete.

Male.- Length $1.8-2.1 \mathrm{~mm}, 3.2$ times as long as wide; color dark brown.

Frons broadly convex; surface rugose-reticulate, punctures rather coarse, close, not sharply impressed; vestiture inconspicuous. Antennal club 1.2 times as long as wide.

Pronotum 1.4 times as long as wide; sides straight and parallel on basal two-thirds, rather broadly rounded in front; anterior
margin broadly subserrate; summit indefinite, one-third pronotum length from anterior margin; anterior slope rather strongly declivous, finely asperate; posterior areas reticulate, minutely, rather sparsely punctured. Glabrous.

Elytra 1.9 times as long as wide, 1.4 times as long as pronotum; sides straight and parallel on basal two-thirds, then very slightly tapered to level of sutural apex, broadly rounded behind except rather deeply emarginate on median one-fifth; surface reticulate, punctures minute, shallow, confused. Declivity moderately steep, shallowly sulcate on upper half, shallowly concave below; spine 1 on interstriae 2 slightly above middle, small, pointed, conical, spine 2 almost at level of sutural apex slightly nearer to lateral margin than to suture, variable in size but usually smaller than spine 1 ; surface reticulate except sometimes shining near suture; slightly explanate at apex. Vestiture confined to declivity, of fine, short hair.

Female.- Similar to male except antennal club ornamented on posterior face by long hair; elytral declivity less strongly, more narrowly impressed.

Distribution.- Veracruz to Colombia and Venezuela.

MEXICO: Veracruz: Cordoba. Oaxaca: Totolapan, $7-$ VII-53. 1000 m , S. L. Wood. COSTA RICA: Escasú, San José, 2-X-63, 1300 m , No. 217. Ficus, S. L. Wood. OTHER COUNTRIES: Colombia, Venezuela.

Hosts.- Alexia imperatricia (Venezuela), Coffea arabica (Colombia), Ficus sp.

Biology.- Specimens were taken in limbs $5-10 \mathrm{~cm}$ in diameter.

Notes - The above treatment was based on seven specimens, two of which were compared directly to the holotypes of exornatum and gracilicornum.

## 41. Monarthrum carinatum Wood

Monarthrum carinatum Wood, 1974, Great Basin Nat. 34:139 (Holotype, male; Cerro de la Muerte, San José, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from exornatum (Schedl) by the larger size, by the fine, median, frontal carina, and by the steeper, more strongly impressed, more weakly explanate elytral declivity.

Male.- Length $2.5-2.8 \mathrm{~mm}, 3.0$ times as long as wide; color dark brown.

Frons convex, a fine, acute, low carina from epistoma almost to upper level of eyes; surface on lower half etched by minute, subaciculate lines, more nearly smooth and shining above, punctures fine but superficially appearing large, indistinct, obscurely subaciculate; obscure vestiture confined to epistomal margin. Antennal club broadly oval, 1.3 times as long as wide.

Pronotum 1.3 times as long as wide; about as in exornatum except anterior margin rather coarsely serrate.

Elytra 2.0 times as long as wide, 1.5 times as long as pronotum; outline more broadly rounded behind than exornatum; disc as in exornatum, declivity steeper, more deeply, more broadly impresed; spines 1 and 2 small, conical, pointed, 1 one-third declivital length from base, on rounded lateral margin, 2 twothirds declivital length from base, slightly mesad of margin; surface of impressed area finely rugose-reticulate except almost smooth and very finely punctured near suture on lower half; apical margin acute, weakly explanate. A few setae on or near margins of declivity.

Female.- Similar to male except frontal carina longer; posterior face of antennal club ornamented by longer hair; elytral declivity less strongly impressed, denticles slightly smaller.

Distribution.- Costa Rica.
costa rica: Cerro de la Muerte, San José, 6 -Vill63.2600 m . No. I 13 , tree bole. S. L. Wood.

Biology.- Specimens were taken from the bole of a standing tree 30 cm in diameter; it apparently was a Melastomaceae.

Notes.- The above treatment was based on the type series of 14 specimens.

Several similar South American species have a median frontal carina, but in those species the antennal club, particularly in the female, is much more elongate.

## 42. Monarthrum desum (Wood)

Fig. 216
Microcorthylus desus Wood, 1967, Great Basin Nat. 27:52 (Holotype, male: I6 miles or 25 km E Morelia, Michoacán, Mexico: Wood Coll.)
Diagnosis.- This species is distinguished from punctifrons (Blandford) by the subvertical male declivity that lacks a sutural emargination and denticles at the base on
interstriae 1 , by the presence of a median carina on the frons, and by other characters. The true relationship probably is remote.

Male.- Length $1.8-2.1 \mathrm{~mm}, 2.5$ times as long as wide; color brown.

Frons convex, coarsely, not closely or deeply punctured, with a small, elongate median tubercle at upper level of eyes; vestiture inconspicuous. Antennal club oval, 1.5 times as long as wide, widest at middle, two sutures very weakly angulate; funicle one-segmented.

Pronotum 1.3 times as long as wide; sides straight and subparallel on basal half, rather broadly rounded in front; anterior margin unarmed; summit at middle; posterior area reticulate, dull, very finely, sparsely punctured; dise glabrous.

Elytra about 1.5 times as long as wide; sides straight and parallel to declivital base, posterior margin straight, posterior angles curving caudomesad to form lower declivital spines with their apices directed mesad; elytral punctures small, indistinct, confused, surface reticulate, dull. Declivity abrupt, subvertical, somewhat more gradually rounded at base near suture; face broadly, rather shallowly concave, lateral margin rather strongly, broadly elevated and armed by a rather large, pointed tubercle on upper third about in line with normal position of striae 3 and a larger incurved, hooked spine two-thirds of declivital length from top; height of lower spine about equal to its basal width, its apex directed mesad; apical margin acutely, not strongly elevated on median half of elytral width, not at all emarginate at suture. Vestiture not conspicuous, limited to sides and declivity.

Female.- Similar to male except elytral declivity less strongly sculptured, only moderately impressed, lateral areas not high, tubercles small; apical margin of elytra, frons, and antenna as in male.

Distribution.- Chihuahua to Michoacán.
MEXICO: Chihuahua: San Juanito, 4-V-77, Quercus, M. M. Furniss. Michoacán: 25 km E Morelia, I4-Vl-65, $2500 \mathrm{~m}, \mathrm{No} .32$. Quercus, S. L. Wood.

## Hosts.- Quercus sp.

Biology.-Specimens were taken from a limb of a large, recently felled oak tree.

Notes.- The above treatment was based on the type series of 20 specimens.

## 43. Monarthrum punctifrons (Blandford)

Pterocyclon punctifrons Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):278 (Holotype, female; Volcán de Chiriquí, Panama; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from conversum Wood by the smaller size, by the more slender body form, by the more broadly, more shallowly concave elytral declivity, with more slender spines, and by other characters.

Male. - Length 2.7-3.2 mm, 2.8 times as long as wide; color light brown, anterior half of pronotum and posterior half of elytra often darker.

Frons as in conversum except reticulation restricted to lower half of area below upper level of eyes, and transverse epistomal impression more abrupt and deeper.
Pronotum 1.2 times as long as wide; as in conversum except punctures in posterior areas minute and not extended by transverse lines.

Elytra 1.5 times as long as wide, 1.3 times as long as pronotum; outline as in conversum except more broadly rounded behind; disc reticulate, punctures minute, almost obsolete, confused. Declivity rather abrupt, very steep, shallowly, broadly concave; lateral margins rather narrowly rounded on upper twothirds, acute on lower third; interstriae 1 at base with a rounded tubercle, spine 1 on interstriae 3 at basal margin, conical, as long as wide, spine 2 slightly below middle of declivity, displaced from lateral margin about onefourth distance from lateral margin to suture; surface of impressed area rugose-reticulate, obscure punctures indicated on mesal half; margins of deep emargination slightly elevated. Subglabrous.

Female. - Similar to male except posterior face of antennal club ornamented by long hair; anterior margin of pronotum weakly serrate; declivity as in female conversum except entirely reticulate, without punctures.

Distribution.- Costa Rica to Panama.
COSTA RICA: 15 km SE Cartago, 3-Vll-63, 1800 m , No. 16, 29-V11-63, No. 20, log, S. L. Wood; Volcán Poás, 14-VII-63, 2500 m , No. 50 , $\log$, S. L. Wood. PANAMA: Volcán de Chiriquí, G. C. Champion.
Biology. - Specimens were cut from logs $20-40 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on 37 specimens, 2 of which were compared directly to the holotype.

## 44. Monarthrum pseudoscutellare (Schedl)

Pterocyclon pseudoscutellarc Schedl, 1935. Rev. de Ent. 5:349 (Holotype, female; Laguna Volcán Poas, Costa Rica; Schedl Coll.)
Monarthrum adustum Wood, 1974, Great Basin Nat. 34:140 (Holotype, male; Cerro de la Muerte, San José, Costa Rica; Wood Coll.). New synonymy
Diagnosis.- This species is distinguished from punctifrons (Blandford) by the larger size and by the very different elytral declivity in both sexes.

Male.- Length $2.8-3.4 \mathrm{~mm}, 3.1$ times as long as wide: color dark brown, bases of pronotum and elytra often of lighter color.

Frons, pronotum, and elytral dise as in punctifrons. Elytral declivity similar to punctifrons but much more narrowly impressed, deeply sulcate on basal half; tubercle at base on interstriae 1 almost obsolete; spines 1 and 2 subequal in size, small, conical, 2 at middle of declivity; surface reticulate. Vestiture largely confined to declivity, of short, moderately abundant hair.

Female.- Similar to male except posterior face of antennal club ornamented by long hair; anterior margin of pronotum weakly serrate; elytral declivity less strongly, more narrowly impressed; space between members of first pair of denticles equal to distance between members of second pair.

Distribution.- Costa Rica.
COSTA RICA: Cerro de la Muerte, San José, 1-Vili$63,3000 \mathrm{~m}$, No. 45, Quercus, 6-V111-63, 2800 m , No. 110, Q. costaricensis, S. L. Wood; Volcán Irazu, Cartago, 2300 m , No. 40, Quercus, S. L. Wood; Volcán Poás. Heredia, 19-V1-66, 2600 m , No. 4, Qucrcus, S. L. Wood.

Hosts.- Quercus costaricensis, Q. spp.
Biology.-Specimens were cut from standing boles and cut logs $30-80 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 65 specimens.

## 45. Monarthrum difficile (Blandford)

Ptcrocyclon difficile Blandford, 1904. Biol. Centr. Amer., Coleopt. 4(6):276 (Holotype, female; Volcán de Chiriqui, Chiriquí Panama; British Mus. Nat. Hist.)

Diagnosis. - The female of this species is distinguished from insignatum Wood by the larger size, by the much more coarsely punctured frons, with the transverse impression above the epistoma less strongly developed and the median tubercle moderately to obscurely developed, and by the stouter body form.

Female.- Length $2.8-3.1 \mathrm{~mm}, 2.5$ times as long as wide; color very dark brown.

Frons broadly convex, transverse impression above epistoma about half as deep as in insignatum, median tubercle poorly developed (about as in hoegei Blandford); surface reticulate on lower third, smooth and shining above, punctures very coarse, deep, much closer in lateral areas. Antenna, pronotum, and elytra as in insignatum except discal punctures on elytra smaller, mostly obsolete; declivital sulcus narrower, not quite so deep, ascending more gradually from suture to lateral convexities; lower pair of declivital spines more closely spaced from one another than upper spines.

Distribution.- Costa Rica to Panama.
COSTA RICA: Escasú, San José, 2-X-63, 1300 m , No. 218 , tree seedling, S. L. Wood. PANAMA: Volcán de Chiriquí, Chiriquí, 3-4000 ft, G. C. Champion.

Notes.- The above treatment was based on the female holotype and on two other specimens.
46. Monarthrum insignatum Wood

Monarthrum insignatum Wood, 1974, Great Basin Nat. 34:141 (Holotype, female; Volcán Poás, Heredia, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from heogei (Blandford) by the median third of the declivity being smooth, with numerous minute, impressed points, and by the minute features on the frons as described below.

Male.- Length 2.4-2.6 mm, 2.9 times as long as wide; color dark brown.

Frons as in hoegei except punctures slightly coarser, deeper, median carina slightly sharper. Pronotum and elytra as in hoegei except median third of declivital excavation smooth, with numerous minute, impressed points.

Female.- Similar to female hoegei except transverse impression above epistoma deeper, its upper margin on median line rising very abruptly to a conspicuous median tubercle, tubercle much larger than in hoegei, frons
protruding slightly toward tubercle; elytral declivity smooth, with points.

Distribution.- Costa Rica.
COSTA RICA: Volcán Poas, Heredia, 14-VII-63, 1500 m , No. 44, tree branch, and 19-Vl-66, 2600 m, No. 4, shrub, S. L. Wood.

Notes.- The above treatment was based on the type series of nine specimens. In all probability future collecting will prove this to be a geographical race of hoegei.

## 47. Monarthrum fastigiorum Wood

Monarthrum fastigiorum Wood, 1974, Great Basin Nat. 34:141 (Holotype, female; Tapanti, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from insignatum Wood by the smaller size, by the more protuberant female frons with a subcarinate dorsal continuation of the median tubercle, and by the different male declivity.

Male.- Length 2.0 mm (female 2.3 mm ), 2.7 times as long as wide; color brown, somewhat bicolored.

Frons as in insignatum except with a fine, low median carina.

Pronotum and elytral dise as in insignatum. Elytral declivity similar to insignatum except steeper, more widely, more shallowly impressed, about one-third of impressed area laterad of a line drawn from spine 1 to spine 2 , spine 2 equal distance from suture and lateral margin.

Female.-Similar to female insignatum except frons more protuberant, median tubercle larger, with weak carina extending from its summit to upper level of eyes, surface more coarsely, more uniformly reticulate; declivital spine 2 almost as close to suture as to lateral margin.

Distribution.- Costa Rica.
COSTA RICA: Tapanti, Cartago, 24 C - $63,1300 \mathrm{~m}$, No. 245, woody vine, S. L. Wood.

Notes.- The above treatment was based on the type series of three specimens.

## 48. Monarthrum bidentatum Wood

Monarthrum bidentatum Wood, 1974, Great Basin Nat. 34:142 (Holotype, male; 6 miles or 9 km NE Teziutlán, Puebla, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from bidens (Blandford) by the smaller size, by the more finely punctured frons, and by
other differences on the female frons and on the male declivity.

Male.- Length 2.3-2.5 mm, 2.8 times as long as wide; color dark brown.

Frons broadly convex, a distinct, transverse impression just above epistoma; surface almost smooth except rugose-reticulate in impressed area, upper areas with impressed points and a few fine punctures; vestiture inconspicuous.

Pronotum 1.2 times as long as wide; as in punctifrons (Blandford) and other allied species.

Elytra 1.5 times as long as wide, 1.3 times as long as pronotum; sides straight and parallel on basal two-thirds, converging very slightly to level of sutural apex, then abruptly rounded behind except moderately emarginate on median fourth; surface reticulate, punctures minute, confused. Declivity rather abrupt, steep, broadly sulcate; sulcus widest between spines 1 and 2 ; spine 1 at base on interstriae 3 , very small; spine 2 closer to suture than to either spine 1 or lateral margin, its lower margin at level of sutural apex; spine 2 laterally compressed, not as high as length of its longitudinal, basal axis, its summit emarginate and bituberculate; surface reticulate. Vestiture sparse, confined to declivity.

Female.- Similar to male except transverse frontal impression very deep, deepest on its median third, occupying lower twothirds of area below upper level of eyes, punctures in lateral areas larger, deeper; posterior face of antennal club ornamented by long hair; anterior margin of pronotum unarmed; declivity much more shallowly, more narrowly sulcate, lateral margins more evenly rounded, spines 1 and 2 of similar size and conical shape, equally spaced from suture.

Distribution.- Puebla and possibly Costa Rica.

MEXICO: Puebla: 9 km NE Teziutlán, 2-VII-67, 1600 m, Nos. 135 and 145 in Alnus, No. 140 in a tree limb, S. L. Wood.

Biology.- Specimens were taken from recently cut material $5-25 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 33 specimens. Two specimens from 15 km SE Cartago, Cartago, Costa Rica, 24-IX-63, 1800 m, No. 203, Siparuna
nicaraguensis, are tentatively assigned here, although the female frons is more coarsely punctured, with the transverse groove partly rugose and not quite as deep on its median third.

## 49. Monarthrum bidens (Blandford)

Pterocyclon bidens Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):277 (Holotype, male; Volcán de Chiriquí. Panama; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from bidentatum Wood by the larger size, by the coarser punctures on the frons, and by differences on the female frons and on the male declivity.

Male.- Length $2.7-2.8 \mathrm{~mm}, 3.0$ times as long as wide; color dark brown.

Frons as in bidentatum except transverse impression greatly reduced, punctures larger. Pronotum and elytra as in bidentatum except posterior half of elytral dise smooth; elytral declivity not as steep, more broadly, subconcavely impressed, spine 2 as high or higher than its longitudinal, basal width; declivital surface smooth, with numerous minute, impressed points.

Female.- As in female of bidentatum except frontal impression deepest on lateral thirds, punctures much coarser: declivital spines 1 and 2 coarser.
Distribution.- Costa Rica to Panama.
COSTA RICA: 15 km SE Cartago, 3-V11-63, 1800 m , No. 17B, Conostegia oerstediana, S. L. Wood. PANAMA: Volcán de Chiriquí, G. C. Champion.

Biology.- Specimens were taken from recently cut branches $1-3 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on 11 specimens, one of which was compared directly to the holotype.

## 50. Monarthrum notatum Wood

Monarthrum notatum Wood, 1974, Great Basin Nat. $34: 143$ (Holotype, female; Volcán Poás, Heredia, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from bidentatum Wood by the color, by the conical spine 2 on the male declivity, and by the deeper, narrower declivital impression.

Male.- Length 2.2-2.5 mm, 3.2 times as long as wide; color dark brown, most specimens with elytral disc yellowish brown.

Frons as in bidentatum except punctures larger. Pronotum and elytral dise as in
bidentatum; elytral declivity much more deeply impressed than in bidentatum, lateral margins more narrowly rounded, spine 2 conical, much larger than 1 , its height equal to its basal width, much closer to lateral margin than to suture, surface reticulate except smooth on interstriae 2. Vestiture confined to declivity, sparse.

Female.- Similar to female dentatum except frons more evenly convex, deepest part of transverse impression rugose-reticulate (smooth in dentatum); declivital sulcus much deeper, narrower, sutural emargination deeper, narrower, its margins distinctly elevated.

Distribution.- Costa Rica to Panama.
COSTA RICA: Volcán Poás, Heredia, 14-VII-63, 2500 m, No. 50, $\log$, 19-VI-66, 2600 m , No. 7, leguminous shrub, S. L. Wood. PANAMA: Cerro Punta; Chiriquí, 11-1-64, 1800 m , No. 371, Inga, S. L. Wood.

Biology. - Specimens were cut from logs 8 and 100 cm in diameter.

Notes.- The above treatment was based on the type series of 17 specimens.

## 51. Monarthrum vittatum (Blandford)

Pterocyclon vittatum Blandford, 1905, Biol. Centr. Amer., Coleopt. 4(6):282 (Holotype, female; Volcán de Chiriquí; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from notatum Wood by the larger size, by the narrow transverse groove above the epistoma in both sexes, and by the less strongly impressed male declivity that has rather coarse, impressed punctures on its median third.

Male.- Length $2.6-3.0 \mathrm{~mm}, 2.7$ times as long as wide; usually bicolored, middle third of pronotum, elytral disc, and appendages light brown, remaining areas dark brown.

Frons broadly convex, a narrower, moderately deep groove extending entire width immediately above epistoma, its fundus usually ornamented by one row of very minute granules; remaining surface reticulate near groove, smooth above with minute impressed points, punctures rather fine, moderately abundant almost to vertex; glabrous except a few hairs on epistoma.

Pronotum and elytral disc as in punctifrons (Blandford). Elytral declivity similar to but less strongly impressed than in notatum, spine 2 distinctly smaller; basal half with punctures on striae 1 rather coarse,
impressed, their dorsomedian margins often subgranulate, lower half with similar punctures confused and somewhat more widely distributed; surfaces reticulate. Subglabrous.

Female. - Similar to male except frontal groove more perfectly formed and slightly deeper; posterior face of antennal club ornamented by a tuft of long hair; declivity slightly less strongly impressed, spine 2 as small as spine 1 , punctures reduced to obsolete.

## Distribution.- Costa Rica to Panama.

costa rica: Cerro de la Muerte, San José, 6-Vili$63,2500 \mathrm{~m}$, No. 112, Brunellia costaricensis, S. L. Wood; Volcán Poás, Heredia, 6-IX-63, 2500 m , No. 170, Clusia, S. L. Wood; intercepted at San Pedro, California in Quercus logs from Costa Rica, 28-V1-46.

Hosts.- Brunellia costaricensis, Clusia sp., Quercus sp.

Biology. - Specimens were cut from material $25-100 \mathrm{~cm}$ in diameter. Although cut or broken material is preferred, in one area apparently healthy trees were killed by this species as a result of population buildup in slash.

Notes.- The above treatment was based on 79 specimens, 2 of which were compared directly to the holotype.

## 52. Monarthrum limulum Wood

Monarthrum limulum Wood, 1974, Great Basin Nat. 34:143 (Holotype, male; Tapantí, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from robustum (Schedl) by the smoother pronotal disc, by the minute declivital granules that have replaced the punctures, and by having spine 2 strongly displaced toward the suture.

Male.- Length $2.2-2.6 \mathrm{~mm}, 2.5$ times as long as wide; color brown.

Frons essentially as in robustum.
Pronotum as in robustum except disc smooth, minutely reticulate, punctures very minute.

Elytra with basic contours about as in robustum, with declivity commencing at middle, except lower half steeper; disc reticulate, punctures very fine, confused; declivital punctures anterior to spine 1 replaced by minute granules, granules on middle third almost obsolete, granules below spine 2 rather coarse; spine 1 conical, without ridge extending cephalad from its summit; spine 2 slightly
closer to lateral margin than to suture, not connected to lateral margin, conical, slightly larger than in robustum; declivital surfaces reticulate, almost rugose in some areas. Vestiture confined to declivity, of fine, short, moderately abundant hair.

Female.- Similar to female robustum except frons more coarsely punctured; pronotal disc more finely punctured; declivity reticulate, punctures minute, with most of them accompanied by a very fine granule; declivital spine 2 almost as close to suture as to lateral margin.

Distribution.- Costa Rica.
COSTA RICA: Tapantí, Cartago, 17-IX-63, 1300 m , No. 178, woody vine, S. L. Wood.

Notes.- The above treatment was based on the type series of 14 specimens.

## 53. Monarthrum glabrifrons (Blandford)

Pterocyclon glabrifrons Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):278 (Lectotype, female; Quiché Mts., Guatemala; British Mus. Nat. Hist., present designation)
Diagnosis.- This species was named from two female syntypes that do not match any of the material before me. They are very similar to females of limulum Wood, but their exact position in the genus cannot be determined until males are available for study. The females of this species are distinguished from female limulum by the uniformly reticulate, much more finely punctured frons, with the epistomal margin somewhat abruptly, slightly elevated (without a definite transverse impression as in limulum), by the distinct, fine, confused punctures on the elytral disc, and by the more shallowly impressed elytral declivity, with tubercles 1 and 2 slightly smaller.

Female.- Length $2.7 \mathrm{~mm}, 2.7$ times as long as wide; as in limulum except as noted in the above diagnosis.

Distribution.- Guatemala.
Guatemala: Quiché Mts., $7000-9000 \mathrm{ft}$, G. C. Champion.

Notes. - The above treatment was based on the two syntypes that are mounted on one microcard on one pin. The specimen on the left side of the card, marked by an arrow and the word "type," is here designated as the lectotype of glabrifrons (Blandford).

## 54. Monarthrum carinulum Wood

Monarthrum carinulum Wood, 1974, Great Basin Nat. 34:144 (Holotype, male; Tapantí, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from vittatum (Blandford) by the absence of a transverse frontal groove and the presence of a median frontal carina in both sexes and by the different female declivity.

Male.- Length $2.3-2.6 \mathrm{~mm}, 2.7$ times as long as wide; color brown.

Frons broadly convex, a low, subacute median carina extending from epistoma almost to upper level of eyes; surface strongly reticulate, punctures fine, moderately abundant; glabrous.

Pronotum and elytral disc and declivity as in insignatum Wood.

Female.- Similar to male except frontal carina higher and longer; posterior face of antennal club ornamented by a tuft of hair; declivity less strongly impressed, slightly narrower, spines 1 and 2 slightly smaller, tubercle at apex of striae 1 entirely absent.

Distribution.- Costa Rica.
COSTA RICA: Tapantí, Cartago, $1300 \mathrm{~m}, 17$-LX-63, No. 178 in a woody vine, No. 184 in Miconia caudata, 26-X1-63, No. 265, Phoebe mexicana, S. L. Wood.

Biology.- Specimens were taken from branches $3-8 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 16 specimens.

## 55. Monarthrum subgranulatum Wood

Monarthrum subgranulatum Wood, 1974, Great Basin Nat. 34:144 (Holotype, male; Cerro Peña Blanca, Honduras; Wood Coll.)
Diagnosis.- This species is distinguished from granulatum Bright by the frontal and declivital characters described below.

Male.- Length $2.4-2.8 \mathrm{~mm}, 2.7$ times as long as wide; color dark reddish brown.

Frons broadly convex, a weak transverse impression just above epistomal margin; lower half of area below upper level of eyes strongly rugose-reticulate, upper area smooth, with moderately abundant impressed points and rather small punctures, transition between areas rather abrupt; rugose area sparsely, finely pubescent.

Pronotum and elytral disc essentially as in punctifrons (Blandford), elytral declivity
steep, strongly sulcate, more broadly flattened below spine 2 ; sulcus occupying median half on upper two-thirds, sutural interstriae feebly elevated, gradually ascending to broadly rounded, rather strongly elevated lateral margins; spine 1 small, at middle on margin; spine 2 one-fourth declivital length from apex, slightly closer to lateral margin than to suture, moderately large, conical, about as high as its basal width; inner margin of middle third of sulcus, just mesad of spine 1 , armed by a row of about four to six small granules all smaller than spine 1 ; surface reticulate. Vestiture very sparse, confined to margins of declivity.

Female.- Similar to male except rugose area on frons slightly larger and with much more abundant, fine, hairlike pubescence; posterior face of antennal club ornamented by a tuft of long hair; anterior margin of pronotum unarmed; declivity less strongly impressed, lateral margins more broadly rounded, spine 2 smaller, granules absent near summit of inner margin.

Distribution.- Honduras.
HONDURAS: Cerro Peña Blanca, 23-IV-64, 1900 m , No. 531, Persea popenoi, S. L. Wood.

Biology.-Specimens were taken from a limb 15 cm in diameter.

Notes. - The above treatment was based on the type series of 28 specimens.

## 56. Monarthrum granulatum Bright

Monarthrum granulatum Bright, 1972, Canadian Ent. 104:1382 (Holotype, male; 24 km or 15 miles S Valle Nacional, Oaxaca, Mexico; Canadian Nat. Coll., 12653)
Diagnosis.- This species is distinguished from subgranulatum Wood as indicated below.

Male.- Length 2.6-2.8 mm, 2.7 times as long as wide; color dark reddish brown.

Frons as in subgranulatum except slightly more coarsely punctured, rugose area less definite, some reticulation extending to upper level of eyes; glabrous except on epistomal margin. Elytral declivity with floor of sulcus more broadly impressed, its lateral walls subvertical; sutural interstriae more distinctly elevated; granules on inner margin of lateral convexities much larger, almost as large as spines 1 and 2.

Female.- Similar to female of subgranulatum except devoid of pubescence, rugose area less definite as in male; declivity slightly steeper.

Distribution.- Puebla to Oaxaca.
MEXICO: Oaxaca: 24 km ( 15 miles) S Valle Nacional, $20-\mathrm{V}-71,1300 \mathrm{~m}$, D. E. Bright. Puebla: 9 km NE Teziutlán, 2-VII-67, 1600 m , No. 146, tree branch, S. L. Wood.

Notes.- The above treatment was based on the holotype, on two paratypes, and on five other specimens.

## 57. Monarthrum infradentatum Wood

Monarthrum infradentatum Wood, 197t, Great Basin Nat. 34:145 (Holotype, male; Rincón de Osa, Puntarenas. Costa Rica: Wood Coll.)
Diagnosis.- This species is distinguished from all preceding species by the obliquely truncate elytral declivity, with the ventrolateral margin acutely elevated from the sutural emargination to the level of spine 1 , and by the absence of spine 2 . It is distinguished from the three following species by the presence of a large spine on the margin of the apical emargination of the elytra.

Male.- Length 1.4 mm , about 3.0 times as long as wide (elytra spread); color dark reddish brown, base of pronotum pale.

Frons broadly convex, a weak transverse impression just above epistoma; surface reticulate, small punctures obscurely indicated.

Pronotum 1.3 times as long as wide; about as in punctifrons (Blandford) except anterior margin armed by eight serrations.

Elytra about 1.7 times as long as wide, about 1.3 times as long as pronotum; sides almost straight and parallel to level of sutural apex, very broadly rounded to apical denticles and emargination; surface reticulate, minute punctures apparently in rows except confused near base. Declivity very steep, truncate, shallowly concave; basal margin rather abruptly rounded to striae 3 , acutely margined from there to apical emargination; spine 1 small, conical, situated just below margin on interstriae 3; face of declivity smooth, shining, with minute points and small punctures, except somewhat rugose near margins; sutural emargination rather narrow, deep, its margin extended perpendicular to declivital surface and forming a large denticle on its basal half, denticle
height equal to its greatest basal width. Vestiture confined to declivity near margins, sparse, mostly short.

Female.- Similar to male except posterior face of antennal club ornamented by long hair; anterior margin of pronotum unarmed; declivity weakly convex, lateral margin acutely raised on lower third, margin of emargination weakly elevated, denticle not evident.

Distribution.- Costa Rica.
COSTA RICA: Rincón de Osa, Puntarenas, 11-V111$66,30 \mathrm{~m}$, No. 86 , tree limb, S. L. Wood.

Notes.- The above treatment was based on the type series of three specimens.

## 58. Monarthrum corculum Wood

Monarthrum corculum Wood, 1974, Great Basin Nat. 34:146 (Holotype, male; Turrialba, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from infradentatum Wood by the larger size and by characters of the elytral declivity.

Male.- Length 1.7-1.9 mm, 2.8 times as long as wide; color dark reddish brown except base of pronotum pale.

Frons, pronotum, and elytral disc as in infradentatum. Elytral declivity similar to infradentatum except declivital outline heart shaped, spine 1 on basal margin at interstriae 3 , spine 2 two-thirds declivital length from base, equal distances from suture and lateral margin; sutural emargination strongly obtuse, shallow, its margin moderately elevated but not forming a tooth; declivital surface shining, finely, rather closely punctured. Vestiture confined to declivity, consisting of moderately abundant, short hair.

Female.-Similar to male except frons with a rather strong, transverse impression just above epistoma; posterior face of antennal club ornamented by a tuft of long hair; anterior margin of pronotum unarmed; declivity with acute margin only on lower third, apical margin less strongly elevated.

Distribution.- Costa Rica.
COSTA RICA: Finca La Lola, Limón, 22-VI-63, Theobroma cacao, J. L. Saunders; Turrialba, Cartago, 9-111$64,700 \mathrm{~m}$, No. 497 B, woody vine, S. L. Wood.

Notes.- The above treatment was based on the type series of 45 specimens.

## 59. Monarthrum posticum Wood

Monarthrum posticum Wood, 1974, Great Basin Nat. 34:146 (Holotype, male; Santa Ana, San José, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from corculum Wood by the much more coarsely punctured frons, by the smooth elytra, and by the different declivity.

Male.- Length $1.7-2.1 \mathrm{~mm}, 2.6$ times as long as wide; color dark reddish brown except base of pronotum usually pale.

Frons as in corculum except surface smooth, with rather dense impressed points and rather coarse punctures.

Pronotum and elytra similar to corculum except slightly stouter; elytral dise smooth and shining except obscurely reticulate near base, strial punctures minute, in rows. Elytral declivity as in corculum except much less strongly impressed, posterolateral angles much more abrupt, surface smoother, brightly shining, punctures much larger.

Female.- Similar to male except frons more nearly subgranulate; posterior face of antennal club ornamented by a tuft of long hair; anterior margin of pronotum unarmed; declivity with margin on basal third more broadly rounded, lateral two-thirds more nearly convex.

Distribution.- Costa Rica.
COSTA RiCA: Finca Gromaco on Río Coto Brus, Puntarenas, I4-V1I-63, 500 m , Nos. 57, 61, 80, woody vines and tree seedlings, S. L. Wood; Rincón de Osa, Puntarenas, ll-VIII-66, 30 m , No. 85 , tree limb, S. L. Wood; Santa Ana, San José, 4-X-63, 1300 m, No. 222. tree seedling, S. L. Wood; Tapantí, Cartago, 24-X-63, 1.300 m , No. 268, tree limb, S. L. Wood.

Biology.- Specimens were cut from material $8-30 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 53 specimens.

## 60. Monarthrum proximum Wood

Monarthrum proximum Wood, 1974, Great Basin Nat. 34:147 (Holotype, male; San Isidro del General, San José, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from posticum Wood by the larger average size and by characters of the frons and declivity described below.

Male.- Length $1.9-2.3 \mathrm{~mm}, 2.4$ times as long as wide. As in posticum except frons more finely punctured, reticulate on lower
half; distance between apical and subapical margins greater.

Female.- Similar to female posticum except transverse impression above epistoma deeper, more abrupt, frons almost entirely reticulate.

Distribution.-Costa Rica and Venezuela.

COSTA RICA: Finca Gromaco on Río Coto Brus, Puntarenas, I4-VIl-63, 500 m , No. 57, log, S. L. Wood; Rincón de Osa, Puntarenas, 11-VIII-66, 30 m , No. 85 , tree limb, S. L. Wood; San Isidro del General, San José, 5-XII-63, 1000 m , No. 284, Miconia pubescens, S. L. Wood; Río Damitas, Dota Mts., San José, 22-VIIl-63, $250 \mathrm{~m}, \mathrm{~S}$. L. Wood. VENEZUELA: 30 km E Palamar, Bolivar, 12-VI-70, 70 m , No. 557, Alexa imperatricia, S. L. Wood.

Biology. - Specimens were taken from recently cut or broken material $10-25 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 32 specimens.

## Genus GLOCHINOCERUS Blandford

Glochinocerus Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):266 (Type-species: Glochinocerus retusipennis Blandford, subsequent designation by Hopkins, 1914, Proc. U.S. Nat. Mus. 48:122)
Diagnosis.- This genus is distinguished by the 3 -segmented antennal funicle, by the slender antennal club, which is 2.2 or more
times as long as wide, with two straight sutures dividing the club into equal units, by the slender, subinflated protibiae with numerous small tubercles on its posterior face in both sexes, by the concave and distinctively ornamented female frons, and by other characters.

Female.- Length $3.0-3.8 \mathrm{~mm}, 2.5$ times as long as wide.

Frons dimorphic, convex in male, concave and characteristically ornamented by setae in female; eye rather deeply emarginate. Antennal scape elongate, funicle 3 -segmented, club elongate and equally divided into three units by straight sutures. Pronotum slightly longer than wide, weakly declivous on anterior half; lateral margins rounded, without a fine, raised line; anterior margin unarmed in female, armed by two teeth in male. Scutellum rather large, flat. Elytra subtruncate, declivity steep; punctures on dise confused. Protibiae slender, lateral margin partly serrate, posterior face convex, armed by many fine tubercles.

Distribution.- Hidalgo to Guatemala; two species.

Biology.- The species are monogamous ambrosia beetles; both infest logs up to 30 cm in diameter and broken branches 7 cm in diameter. The gallery system is similar to most species of Corthylus and Tricolus.

## Key to the Species of Glochinocerus

1. Interstriae 3 weakly, continuously elevated on upper two-thirds of declivity, its crest armed by a row of three or more small tubercles, remainder of declivity entirely devoid of tubercles or granules; longest female epistomal setae capable of being extended half distance to vertex; elytral declivity glabrous; Guatemala; 3.1-3.8 mm
l. retusipennis Blandford

- Interstriae 3 not elevated, small, confused granules or tubercles scattered over entire declivity, none of them forming a row; longest setae on female epistoma capable of attaining vertex; elytral declivity with rather short, conspicuous hair, some setae equal in length to width of scutellum; Hidalgo to Guatemala; $3.0-3.8 \mathrm{~mm}$

2. gemellus Blandford
3. Glochinocerus retusipennis Blandford Fig. 215

Glochinocerus retusipennis Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):266 (Lectotype, female; Cerro Zunil, Quezaltenango, Guatemala; British Mus. Nat. Hist., present designation)
Diagnosis.- This species is distinguished from gemellus Blandford by characters summarized in the above key.

Female.- Length $3.1-3.8 \mathrm{~mm}, 2.5$ times as long as wide; color very dark brown.

Frons flat and ascending slightly from upper level of eyes to median area of epistoma, shallowly concave from upper level of eyes to vertex; surface subshining, slightly irregular, small punctures obscure; lateral and particularly upper margins of concave area ornamented by a dense row of very long,
coarse, subplumose hair, a few shorter setae scattered on floor of concave area; ventrolateral angles between eye and mandible each bearing a tuft of long, curled, reddish hair, longest of these setae reaching about half distance to upper margin of concave area. Antennal club 1.5 times as long as wide, suture 2 at middle.

Pronotum 1.1 times as long as wide; sides almost straight and parallel on basal half, very broadly rounded in front; summit indefinite, near middle; anterior slope weakly declivous, asperities small, numerous; posterior areas reticulate, punctures almost obsolete. Glabrous except at margins.

Elytra 1.5 times as long as wide, 1.4 times as long as pronotum; sides straight and parallel on basal three-fourths, slightly narrowed, then abruptly, very broadly rounded behind; dise smooth, shining, punctures rather small, close, confused. Declivity very steep, essentially broadly convex except sulcate on triangular area beginning at suture above, occupying median half and ending one-third declivital length from apex; interstriae 3 distinctly, rather narrowly elevated on upper two-thirds and armed by a row of about 3 to 10 fine granules; posterolateral margin acutely, not strongly elevated on lower half to apex; surface reticulate, without punctures or granules except on interstriae 3. Declivity glabrous, sides with sparse, short hair.

Male. - Similar to female except frons convex, glabrous, with sparse, rather fine punctures; antennal club 2.4 times as long as wide, suture 2 on apical half; anterior margin of pronotum armed by two coarse serrations.

Distribution.-Guatemala.
gUatemala: Cerro Zunil, Quezaltenango. G. C. Champion; Volcán Pacaya, Esquintla, I-VI-64, 1300 m , No. 671 in tree branch, No. 688 in bole of Caldo de Frijol, S. L. Wood.

Biology.- As described for the genus.
Notes.- The above treatment was based on 57 specimens, 4 of which were compared to Blandford's 4 syntypes. The first female syntype in Blandford's series is here designated as the lectotype of retusipennis Blandford. It has been labeled "type" and has been regarded as the type for many years, although it has never been formally so designated.

## 2. Glochinocerus gemellus Blandford

Glochinocerus gemellus Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):267 (Lectotype, female: Quiché Mountains, El Quiché, Guatemala; British Mus. Nat. Hist., present designation.)
Diagnosis.- This species is distinguished from retusipennis Blandford by characters mentioned in the above key.

Female.- Length $3.0-3.8 \mathrm{~mm}, 2.5$ times as long as wide; color very dark brown.

As in female retusipennis except epistoma deeply emarginate, tips of longest lateral epistomal setae attaining vertex; suture 2 on distal half of antennal club; elytral declivity with granules sparsely distributed over entire surface, confused, interstriae 3 not elevated or granulate, sparsely, conspicuously pubescent, longest setae equal in length to width of scutellum.

Male.- Similar to female except frons convex, punctured, glabrous, epistoma entire; anterior margin of pronotum armed by two coarse serrations.

Distribution.- Hidalgo to Guatemala.
MEXICO: Hidalgo: 31 km E Tulancingo, 12-VI-67, 2300 m , No. 15, Quereus log, S. L. Wood. Mexico: Amecameca, 26-IX-80, 2700 m , Alnus, T. H. Atkinson. Puebla: Zacatlán, 18-II-57, Prunus. GUATEMALA: Volcán Pacaya, I-VI-64, 1300 m , No. 688, tree branch, S. L. Wood. Quché Mts.

Biology.- As described for the genus.
Notes.- The above treatment was based on 24 specimens, 2 females of which were compared to the 2 female syntypes of gemellus. The first syntype, from the Quiché Mountains, is here designated as the lectotype of gemellus Blandford.

## Genus MEtacorthyluS Blandford

Metacorthylus Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):263 (Type-species: Metacorthylus nigripennis Blandford, monobasic)
Paracorthylus Wood, 1968, Great Basin Nat. $28: 7$ (Typespecies: Paracorthylus velutinus Wood, original designation.); Wood, 1976, Great Basin Nat. 36:347. Synonymy
Diagnosis.- This genus is distinguished from Glochinocerus Blandford by characters of the frons, antennae, elytra, and vestiture. The fore tibiae are somewhat sexually dimorphic, as in Monarthrum Kirsch.

Description.- Length $1.9-2.7 \mathrm{~mm}, 2.2$ times as long as wide; antennae, elytra, and protibiae sexually dimorphic.

Frons convex; pubescence sparse. Eye twothirds divided by an emargination. Antennal scape elongate; funicle 2 -segmented; club sexually dimorphic, with two procurved sutures on basal half. Pronotum as in Corthylus.

Scutellum large, almost flat. Elytra subtruncate and entire behind; pubescence minute, recumbent, dense on pronotum and elytra. Protibia sexually dimorphic, posterior face inflated and finely tuberculate in female, almost flat and with few tubercles in male.

Distribution.- Costa Rica to Colombia; four species.

## Key to the Species of Metacorthylus

1. Upper margin of male elytral declivity armed by three pairs of teeth on interstriae $1-3$, lateral pair distinctly larger; sutural apex slightly divaricate; male declivity shallowly concave, its margin subacutely, weakly elevated on more than three-fourths of a circle, sutural interstriae distinctly elevated, female declivity subconcave, margins rounded; Panama; 1.9-2.0 mm ...... 1. mutilus (Wood)

- Upper margin of elytral declivity unarmed in either sex; sutural apex of elytra entire; declivity weakly convex to subconcave, margins rounded on at least upper three-fourths
2(1). Elytral declivity slightly convex; pronotal disc subreticulate, punctures minute, close, spaced by less than about two diameters of a puncture; female interstriae 3 on declivity armed by one tubercle; color yellowish brown to brown; pronotum and elytral disc with abundant, minute, recumbent hair; Costa Rica to Colombia; $1.9-2.0 \mathrm{~mm}$ 2. velutinus (Wood)
- Elytral declivity shallowly subconcave; pronotal disc reticulate, punctures very fine, widely spaced by about four to six diameters of a puncture; female interstriae 3 on declivity armed by two tubercles; color reddish brown; pronotum and elytral disc sparsely pubescent
3(2). Female antennal club 1.9 times as long as wide; elytral declivity not as steep, spine 2 on female almost on lateral margin; Costa Rica; 2.3-2.6 mm
- Female antennal club 1.0 times as long as wide; declivity very steep, spine 2 on female almost as close to suture as to lateral margin; Panama; 2.7 mm

## 4. nigripennis Blandford

## 1. Metacorthylus mutilus (Wood)

Paracorthylus mutilus Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(1):66 (Holotype, female; Fort Sherman, Canal Zone, Panama; Wood Coll.)
Diagnosis.-This species is distinguished from concisus (Wood) by the smaller size, by the shallowly divaricate sutural apex of the elytra, and by the distinctive elytral declivity.

Female.- Length $1.9-2.0 \mathrm{~mm}, 2.7$ times as long as wide; color reddish brown.

Frons as in velutinus (Wood) except surface reticulate above shining epistomal margin. Antennal club 1.4 times as long as wide, apical segment only slightly modified.

Pronotum 1.1 times as long as wide; as in velutinus except surface reticulate, punctures very fine, much less closely spaced.

Elytra 1.4 times as long as wide, 1.2 times as long as pronotum; as in velutinus except declivity. Declivity subvertical, subtruncate, shallowly concave; lateral margins distinctly elevated, rounded, armed on middle third on median margin by two pointed tubercles, upper one slightly larger; sutural interstriae weakly elevated; posterolateral margin subacute at apex, suture weakly emarginate; surface rugose-reticulate; punctures obscure. Very minute setae moderately abundant on declivity, similar but less abundant on disc.

Male.-Similar to female except apical segment of antennal club slightly shorter and
more broadly rounded; anterior margin of pronotum armed by eight serrations of moderate size; declivity more evenly concave, its margins weakly, subacutely elevated on more than lower three-fourths, upper margin armed by three pairs of small teeth on interstriae 1-3, lateral pair conspicuously larger, sutural apex more distinctly emarginate, sutural interstriae more distinctly elevated.

Distribution.- Panama.
Panama: Ft. Sherman, Canal Zone, $10-\mathrm{XI}-57$, at light.

Notes. - The above treatment was based on the type series of four specimens.

## 2. Metacorthylus velutinus (Wood)

Fig. 218

Paracorthylus velutinus Wood, 1968, Great Basin Nat. 28:7 (Holotype, female; Moravia, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- The sexually dimorphic antennae and armature of the elytral declivity and the minute, recumbent vestiture serve to distinguish this species from other species with which it might possibly be confused.

Female.- Length $1.9-2.0 \mathrm{~mm}, 2.2$ times as long as wide; color brown, anterior and posterior extremities somewhat darker.

Frons rather weakly concave; slightly, transversely impressed just above epistomal margin; epistomal margin produced into a small lobe in front of mandibles; an acute median carina on lower half extending to apex of epistomal lobe; surface shining, marked by small points and moderately large, close, deep punctures; vestiture erect, minute, inconspicuous. Eye almost two-thirds divided by a narrow emargination. Antennal funicle 2 -segmented; club 1.6 times as long as wide, narrowly triangular, apex acutely pointed; sutures 1 and 2 subangulately procurved, 2 not extending beyond basal third; mediodistal margin bearing a row of rather long hair, other setae minute.

Pronotum 1.1 times as long as wide; widest on basal half, sides on basal two-thirds feebly arcuate, rather broadly rounded in front; summit rather indefinite, about one-third pronotum length from anterior margin; very finely asperate on anterior slope, dull, very minutely reticulate-granulate behind. Vestiture consisting of rather abundant, minute,
recumbent hair, somewhat longer and more nearly erect in asperate area.

Elytra 1.1 times as long as wide, 1.0 times as long as pronotum; sides almost straight and parallel to a point beyond level of declivital base, very broadly rounded behind; declivity restricted to posterior fourth; strial and interstrial punctures obsolete, surface of disc finely reticulate, dull, a very slight irregularity where small, confused punctures might have been. Declivity abrupt, very steep, weakly convex; surface obscurely, rather closely punctured, impressed toward suture on upper two-thirds; interstriae 3 weakly elevated on upper half, with one blunt tubercle on summit just above middle of declivity. Vestiture minute, recumbent, rather abundant.

Male. - Similar to female except frons more nearly convex, carina shorter; antennal club shorter, broader, much less strongly acuminate; elytral disc near declivity more nearly shining, more clearly punctured; declivital interstriae 3 armed by two moderately large, pointed tubercles, 1 one-third of declivity length from upper margin, 2 slightly larger, two-thirds from upper margin; lower margin of declivity more distinctly elevated.

Distribution.- Costa Rica to Colombia.
COSTA RICA: Moravia, Cartago, 11-III-64, 500 m , fallen tree, S. L. Wood. COLOMBIA: Montegrande, Caicedonia. Valle de Cauca, 19-VI-59, guamo seco, J. Restrepo.

Biology.- These monogamous beetles were in simple, straight tunnels $2-3 \mathrm{~cm}$ below the surface in the bole of a fallen tree where bark had been removed. The tree was in land being cleared and had been down two to three months. The wood was unusually dry and hot and was fully exposed to the sun. The beetles were on the shaded side and appeared to be completely inactive until disturbed.

Notes.- The above treatment was based on the type series of 19 specimens and on 2 other specimens.

## 3. Metacorthylus concisus (Wood)

Paracorthylus concisus Wood, 1974, Brigham Young Univ. Sci. Bull., Biol. Ser. 19(I):67 (Holotype, female: Moravia, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from velutinus (Wood) by the larger size, by

Fig. 218. Corthylini spp., outlines of dorsal aspect, declivities, and antemae: 1, Monarthrum bicolorum ( $=$ bicolor) (Guyana); 2, Monarthrum partum (=preclarus) Guyana); 3a, 3b, 5, Metacorthylus celutinus, male, 4, 6, same, female: 7-8, Gnathotrupes terebratus. (After Wood 1968:5.)
the subconcave elytral declivity, with different armature in the female, by the sparse pubescence, and by other characters.

Female.- Length 2.3-2.6 mm, 2.6 times as long as wide; color reddish brown.

Frons as in velutinus except obscurely reticulate, shining, median carina extending from epistomal margin to median callus on lower third. Antennal club 1.9 times as long as wide, about intermediate in shape between velutinus and mutilus.

Pronotum 1.1 times as long as wide; as in mutilus.

Elytra 1.4 times as long as wide, 1.2 times as long as pronotum; as in mutilus except tubercles slightly larger and apex of suture entire.

Male.- Similar to female except antennal club less elongate, its apex more broadly rounded; anterior margin of pronotum armed by eight serrations; declivity much more broadly, evenly impressed, margins on lower half more distinctly, more narrowly elevated but not angulate, sutural apex entire and bent slightly dorsad, two pairs of tubercles on interstriae 3 displaced mesad from lateral margin, lower one at middle, upper one on basal fourth.

Distribution.- Costa Rica.
COSTA RICA: Moravia, 11-111-64, 500 m , No. 473 , felled tree, S. L. Wood.

Biology.-Specimens were taken in the same cleared area as velutinus but from a different host tree 35 cm in diameter.

Notes.- The above treatment was based on the type series of 16 specimens.

## 4. Metacorthylus nigripennis Blandford

Metacorthylus nigripennis Blandford. 1904, Biol. Centr. Anser., Coleopt. 4(6):263 (Holotype, female; Bugaba, Chiriquí, Panama; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from concisus (Wood) by the larger size, and by characters of the female antennal club and elytral declivity.

Female.- Length $2.7 \mathrm{~mm}, 2.4$ times as long as wide; color yellowish brown with very dark brown elytra.

Frons as in concisus except median callus very slightly larger. Antennal club 1.0 times as long as wide, widest on apical third; sutures feebly procurved; posterior face with a small tuft of hair near apex.

Pronotum and elytral disc as in concisus. Declivity as in concisus except steeper, basal angle more abrupt, upper fourth very slightly more narrowly, more deeply impressed, spine 2 more strongly displaced from lateral margin, almost as close to suture as to lateral margin, vestiture very slightly longer.

Distribution.- Panama.
PANAMA: Bugaba, Chiriquí, $800-1500 \mathrm{ft}$. G. C. Champion.

Notes.- The above treatment was based on the holotype.

## Genus MICROCORTHYLUS Ferrari

Microcorthylus Ferrari, 1867. Die Forst- und Baunzuchtschädlichen Borkenkäfer, p. 58 (Typespecies: Microcorthylus parvulus Ferrari, monobasic)
Diagnosis.- This genus is distinguished from Corthylus Erichson by the rounded lateral margins of the pronotum, which are not marked by a fine, raised line, by the impunctate pronotal and elytral discs (obscure punctures occasionally present), by the unique elytral declivity that always has the lateral margins armed by two pairs of very small denticles (some South American species have several), by the rather simple antennal club, and by other characters.

Description.- Length $1.2-2.4 \mathrm{~mm}$, 2.5-3.1 times as long as wide; color yellowish to dark brown, most body vestiture greatly reduced or absent.

Frons evenly convex (except slightly modified in female of grandiclavatus), subglabrous. Eye emarginate, finely to coarsely granulate. Antennal scape elongate; funicle l-segmented; club longer than scape, oval to obscurely subtriangular, sutures 1 and 2 present except in one species, usually with a tuft of hair on posterior face in female. Pronotum longer than wide; summit obscure, in front of middle; anterior slope with low asperities, anterior margin usually very feebly serrate in female, coarsely serrate in male; posterior areas reticulate, punctures minute and obscure or absent. Scutellum rather large, flat. Elytra about 1.4-1.8 times as long as wide, sides almost straight and parallel on basal two-thirds; discal punctures obscure to obsolete, in rows or confused, surface usually reticulate; declivity steep, sulcate on basal third, variously, more broadly impressed below,
excavated area usually reticulate and without punctures, lateral margins armed by spine 1 near base on interstriae 3 , spine 2 at or slightly above middle, spines very small, pointed. Precoxal piece on prosternum forming a simple vertical, transverse partition, procoxae contiguous; protibia slightly inflated and armed by tubercles on posterior face.

Distribution.- Veracruz to Argentina; 26 species are known; 13 occur in Mexico and Central America.

Biology.- Apparently all species are monogamous, xylomycetophagous, and breed in
recently cut or injured woody stems about $2-5 \mathrm{~cm}$ in diameter. The parental tunnel is started by the male; it usually follows a spiral pattern along a particular growth ring in the wood and has a turning niche just inside from the entrance hole. The larvae are reared in cradles they enlarge as they grow, as in Monarthrum.

Notes.- This genus includes a compact group of small species that exhibit very conservative characters. The differences between species are consistent but often minute, making classification unusually difficult.

## Key to the Species of Microcorthylus

1. Elytral declivity with sutural interstriae on right elytral feebly, distinctly elevated, lateral margin of this elevation marked by a subacute, continuous costa on at least lower half of declivity, granules on interstriae labsent, punctures on striae l obsolete; posterior face of female antennal club usually with tuft of long hair

- Elytral declivity with floor of impressed area rising gradually to suture, striae 1 with two or more distinctly impressed punctures, or interstriae 1 with a row of two or more tubercles near middle of declivity, or both; female antennal club without tuft of long hair on posterior face
2(1). Subapical margin of elytral declivity parallel to costal margin, without any elevated connection to elevated lateral margin of declivity3
- Subapical margin of declivity acutely, continuously elevated from near suture
to lateral margin of declivity ..... 9

3(2). Elytral declivity less strongly, less broadly impressed, slope from suture to summit of lateral margins of impressed area more gradual, uniform4

- Elytral declivity more strongly, more broadly impressed, lateral convexities
abruptly elevated at mesal margin of spines, particularly noticeable just below
spine 2

4(3). Frons with coarser punctures longitudinally elongate, in male rugose-reticulate above epistoma, gradually becoming longitudinally, minutely strigose above to vertex, in female reticulate below, more nearly shining above with longitudinal strigose lines indicated at least in lateral area; Guatemala; $1.6-1.9 \mathrm{~mm}$

- Male frons finely, regularly reticulate from epistoma to vertex, punctures normal, female frons similar but largely smooth, with normal punctures; smaller 5

5(4). Epistoma armed by a small, median tubercle (often obscure in female); male frons reticulate; eyes normal; body stouter; elytra subshining, weakly reticulate; Puebla to Costa Rica; 1.3-1.5 mm
2. demissus Wood

- Epistoma smoother, almost shining, unarmed (female sometimes with a feeble median tubercle); eyes greatly enlarged, coarsely faceted; body slender; elytra usually more strongly reticulate; Costa Rica; 1.3-1.4 mm
$6(3)$. Impressed area of declivity triangular, its lateral margins straight from base to apex of lateral elevations; male pronotum usually armed by two to four serrations
- Impressed area of declivity heart-shaped, its lateral margins conspicuously curved, particularly below spine 2 ; male pronotum usually armed by six to eight serrations
7(6). Elytra uniformly reticulate; impressed area on declivity more broadly triangular, its sides converging above at an angle greater than 45 degrees; Costa Rica to Panama; 1.5-1.6 mm

4. inermis Wood

- Elytral disc subshining, except strongly reticulate near declivity; impressed area on declivity narrowly triangular, its lateral margins converging above at an angle of less than 30 degrees; Nayarit; $1.5-1.6 \mathrm{~mm}$

5. invalidus Wood

8(6). Declivital spine 2 well above middle of declivity, distance from apical margin to spine 2 at least twice as great as distance from spine 1 to spine 2; elytra more slender, 1.6 times as long as wide, disc shining, without any reticulation except on declivity; Costa Rica to Colombia and Venezuela; $1.6-1.7 \mathrm{~mm}$ $\qquad$
6. parvulus Ferrari

- Declivital spine 2 at middle of declivity, distance from apical margin to spine 2 only slightly greater than from spine 1 to spine 2; elytra stouter, 1.4 times as long as wide, disc at least partly reticulate near declivity; Veracruz and Jamaica to Brazil; 1.2-1.3 mm (see also 7. vicinus Wood)

8. minimus Schedl

9(2). Declivital spine 2 closer to spine 1 than to posterior margin of declivity (both spines sometimes obsolete); frons very broad, evenly convex; Costa Rica and Panama; $1.7-1.9 \mathrm{~mm}$
9. pumilus Wood

- Declivital spine 2 closer to posterior margin than to spine 1 ; male frons with a short median carina at epistoma, an obscure median callus to upper level of eyes, female frons below upper level of eyes almost flat on lateral thirds; a rather strongly convex elevation on median third; Guatemala to Honduras; $2.0-2.4 \mathrm{~mm}$

10. pusillus Wood

10(1). Declivital interstriae 1 without granules, minute punctures usually present; antennal club with suture 2 indicated only near margins, apex of club much more broadly rounded; Costa Rica to Panama; 1.5-1.6 mm
11. lassus Wood

- Declivital interstriae 1 with granules, punctures often also present; antennal club with suture 2 marked by a groove and apparently septate throughout its length, segment 3 somewhat triangular; larger species
11(10). Female frons slightly impressed on lateral thirds and also on median third just above epistoma, this impressed area strongly reticulate, dull, median third from slightly below upper level of eyes to near vertex conspicuously inflated and shining; declivity more strongly impressed, male interstriae 1 with four conspicuous granules and accompanying strial punctures, female granules and punctures smaller; Costa Rica and Panama; 1.9-2.2 mm
- Female frons uniformly convex; declivital impression not as strong, male granules somewhat smaller 12

12(11). Declivital granules on interstriae 1 varying from two to four in males, zero to four in females; frons weakly carinate on lower third, impressed points and punctures in upper areas usually finer and not at all strigose; Costa Rica; $1.6-1.8 \mathrm{~mm}$ 13. concisus Wood

- Declivital granules on interstriae 1 varying from four to eight; median epistomal tubercle not at all carinate; frons with impressed points and punctures larger, usually rather distinctly, longitudinally substrigose; Guatemala; 2.0-2.3 mm

14. vescus Wood

## 1. Microcorthylus debilis Wood

Microcorthylus debilis Wood, 1973, Great Basin Nat. 33:265 (Holotype, female; Volcán Pacaya. Guatemala; Wood Coll.)
Diagnosis.- In this species the frontal punctures are rather coarse and elongate and the elytral declivity is only moderately impressed and devoid of an elevation between the costal margin and the lateral margin.

Female.- Length $1.6-1.9 \mathrm{~mm}, 2.8$ times as long as wide; color yellowish brown.

Frons convex, with a distinct transverse impression just above epistoma, a weak, median epistomal process indicated; surface obscurely reticulate in central area, becoming almost rugose-reticulate in marginal areas; punctures coarse for this genus, elongate; subglabrous. Antennal club 1.1 times as long as scape, 1.4 times as long as wide, broadly, somewhat obovate; sutures 1 and 2 almost straight; posterior face with small tuft of hair.

Pronotum 1.1 times as long as wide; widest near base, sides parallel on basal half, broadly rounded in front; about a dozen weakly raised serrations on anterior margin; indefinite summit just anterior to middle; anterior slope moderately steep, rather finely asperate; posterior areas strongly reticulate, sparse, very minute, shallow punctures indicated. Glabrous.

Elytra 1.6 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal two-thirds, then arcuately converging to lateral margin of declivity, broadly rounded behind on median half; strial punctures very obscurely indicated, interstrial punctures obsolete, dical surface subreticulate, subshining. Declivity steep, broadly sulcate; impressed area extending from suture to about striae 1 above and striae 3 or 4 below; sutural interstriae feebly, abruptly elevated, forming a distinct, continuous crest on its lateral margin on right elytron; lateral margins increase in height gradually on upper two-thirds, obsolete below, crest of upper half armed by two pairs of rather widely separated, small, pointed denticles; all punctures obsolete; surface reticulate. Glabrous.

Male.- Similar to female except epistomal process forming a definite median tubercle; serrations on anterior margin of pronotum larger.

Distribution.-Guatemala.

GUATEMALA: Volcán Pacaya, Esquintla, I-VI-64, 1300 m , No. 670, tree branch, S. L. Wood.

Biology.- Specimens were taken from a branch 3 cm in diameter.

Notes.- The above treatment was based on the type series of 60 specimens.

## 2. Microcorthylus demissus Wood

Microcorthylus demissus Wood, 1973, Great Basin Nat. 33:266 (Holotype, female; 6 miles or 9 km NE Teziutlán, Puebla, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from debilis Wood by the smaller size, by the more shining, less strongly punctured female frons, male frons finely reticulate, and by the less strongly impressed elytral declivity.

Female.- Length $1.3-1.5 \mathrm{~mm}, 2.9$ times as long as wide; color yellowish brown.

Frons as in debilis except central half smooth, shining, punctures not elongate; antennal club 1.3 times as long as scape, 1.5 times as long as wide.

Pronotum as in debilis except anterior margin more narrowly rounded.

Elytra as in debilis except declivity less strongly impressed, lateral margins much less strongly elevated.

Male.- Similar to female except frons uniformly, finely reticulate; anterior margin of pronotum armed by six rather coarse serrations; declivital denticles slightly larger.

Distribution.- Puebla and Costa Rica.
MEXICO: Puebla: 9 km NE Teziutlán, $1500 \mathrm{~m}, 27$ -VI-53, No. 45, and 2-VII-67, No. 137, Miconia, S. L. Wood. COSTA RICA: Tapantí, Cartago, 2-VII-63, I300 m , No. 7B in Boehmeria ulmifolia, No. 10 in Conostegia oerstediana, S. L. Wood.

Bıology.- Specimens were taken from cut branches $2-4 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 54 specimens and on 9 other specimens.

## 3. Microcorthylus ocularis Wood

Microcorthylus ocularis Wood, 1973, Great Basin Nat. 33:266 (Holotype, female; Tapantí, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from demissus Wood by the absence of a median epistoma tubercle, by the narrow frons, by the enlarged, coarsely faceted eyes, and by the slender body form.

Female.- Length $1.3-1.4 \mathrm{~mm}, 3.0$ times as long as wide; color yellowish brown.

Frons as in demissus except mostly weakly reticulate and epistomal tubercle reduced or absent. Eyes twice as large as normal, coarsely faceted. Pronotum and elytra rather weakly reticulate.

Distribution.- Costa Rica.
COSTA RICA: Tapantí, Cartago, 2-VII-63, No. 1300 $\mathrm{mm}, 7 \mathrm{~B}$ in Boehmeria ulmifolia, No. 10 in Conostegia oerstediana, S. L. Wood; 15 km SE Cartago, Cartago, 24-X1-63, 1800 m, No. 248, Siparuna nicaraguensis, S. L. Wood.

Biology.- Specimens were taken from cut branches 5-7 cm in diameter.

Notes.- The above treatment was based on the type series of seven specimens.

## 4. Microcorthylus inermis Wood

Microcorthylus inermis Wood, 1973, Great Basin Nat. 33:267 (Holotype, female; 9 miles or 15 km SE Cartago, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This, species is distinguished from demissus Wood by the more strongly impressed elytral declivity, with the lateral margins abruptly but not strongly elevated, by the uniformly, finely, rugose-reticulate frons, and by the broader antennal club.

Female.- Length $1.5-1.6 \mathrm{~mm}, 2.8$ times as long as wide; color dark brown.

Frons broadly convex, a conspicuous median tubercle just above epistomal process; entire surface from epistoma to vertex ru-gose-reticulate, minute punctures almost obsolete. Antennal club 1.3 times as long as scape, 1.3 times as long as wide; broadly obovate; a small tuft of setae on posterior face.

Pronotum 1.1 times as long as wide; as in debilis Wood except posterior areas much more strongly reticulate.

Elytra 1.8 times as long as wide; as in debilis except entire surface uniformly reticulate; declivity more strongly impressed, lateral margins abruptly elevated.

Male.-Similar to female except frontal punctures more distinct; antennal club slightly smaller and devoid of tuft of hair on posterior face; serrations on anterior margin of pronotum rather coarse.

Distribution.- Costa Rica to Panama.
COSTA RICA: 15 km SE Cartago, Cartago, 24-1X-6:3, 1800 m , Nos. 199, 248, Siparuna nicaraguensis, S. L. Wood; Escasú, San José, 2-X-63, 1300 m , No. 215, Guazuma ulmifolia, No. 218, cut seedling, S. L. Wood. PANAMA: Cerro Punta, Chiriquí, II-I-64, I800 m, Nos. 38I, 399, woody vine, S. L. Wood.

Biology.- Specimens were taken from branches less than 4 cm in diameter.

Notes.- The above treatment was based on the type series of 43 specimens.

## 5. Microcorthylus invalidus Wood

Microcorthylus intalidus Wood, 1973. Great Basin Nat. 33:268 (Holotype, female; 4 miles or 6 km W Tepic, Nayarit, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from demissus Wood by the more nearly reticulate frons, by the much more deeply impressed elytral declivity with its margins more abruptly elevated, and by the reticulate female scutellum.

Female.- Length $1.5-1.6 \mathrm{~mm}, 2.8$ times as long as wide; color light brown.

Frons as in demissus except reticulation more extensive in lateral areas. Antennal club 1.2 times as long as wide.

Pronotum 1.2 times as long as wide; as in demissus.

Elytra as in demissus except declivity much more strongly impressed; declivity about as in inermis Wood except lateral margins of impressed area converge toward base at an angle of about 30 degrees (about 45 degrees in inernis).

Male.- Similar to female except frons ru-gose-reticulate, punctures minute; antennal club smaller, without tuft of hair on posterior face; anterior margin rather coarsely serrate.

Distribution.- Nayarit.
MEXICO: Nayarit: 6 km W Tepic, I3-VII-65, 1000 m , Nos. 239, and 240, S. L. Wood.

Biology.-Specimens were taken from recently cut tree limbs 3 cm in diameter.

Notes.- The above treatment was based on the type series of four specimens.

## 6. Microcorthylus parvulus Ferrari

Microcorthylus partulus Ferrari, I867, Die Forst- und Baumzuchtschädlichen Borkenkäfer, p. 58 (Holotype, male: Venezuela, probably Colonia Tovar; Vienna Mus.)
Pterocyclon exile Eichhoff. I878, preprint of Mém. Soc. Rov. Sci. Liége (2)8:451 (Holotype, male; Nova Grenada; Brussels Mus.); Wood, 1974, Great Ba$\sin$ Nat. 34:283. Synonymy
Diagnosis.- This species is distinguished from demissus Wood by the steeper, more strongly, more broadly impressed elytral declivity, with spine 2 placed well above the middle, and by the dense, very minute, impressed points on the declivity that superficially resemble reticulation.

Female.- Length $1.6-1.7 \mathrm{~mm}, 2.7$ times as long as wide; color light brown.

Frons as in demissus except less brightly shining, marginal areas weakly reticulate, punctures slightly smaller, more definite. Antennal club 1.4 times as long as scape, 1.4 times as long as wide; a small tuft of long hair on posterior surface.

Pronotum and elytral disc about as in $d e$ missus, except elytral disc smooth, shining, punctures very minute to obsolete, suture distinctly elevated on posterior half in most specimens. Elytral declivity very steep, much more broadly impressed than in allied species, margins abruptly elevated; surface with very dense minute points, superficially resembling reticulation on lower two-thirds, evidently becoming reticulate toward base; spine 2 placed slightly above middle and closer to 1 than in allied species.

Male.-Similar to female except antennal club without tuft of hair; anterior margin of pronotum armed by six rather coarse serrations; elytra apparently slightly bicolored, punctures more definite, spine 2 slightly larger.

Distribution.- Costa Rica to Venezuela.
COSTA RICA: San Ignacio de Acosta, San José, 5-VII$63,1500 \mathrm{~m}$, No. 28, tree branch, S. L. Wood; Escasú, San José, 2-X-63, 1300 m , No. 216, Spondias purpurea, S. L. Wood. OTHER COUNTRIES: "Nova Grenada," Colombia, Venezuela.

Biology.- Specimens were taken from cut branches less than 5 cm in diameter.

Notes.- The above treatment was based on the holotypes of parvulus and exile and on 159 other specimens. Slight variation occurs within a series in details of the frons, particularly the median tubercle.

## 7. Microcorthylus vicinus Wood

Microcorthylus cicinus Wood, 1977, Great Basin Nat. 37:213 (Holotype, female; 32 miles or 51 km S Valle Nacional, Oaxaca, Mexico; Canadian Nat. Coll.)
Diagnosis.- This species is distinguished from minimus Schedl by the larger size, by the larger epistomal tubercle, by the more strongly reticulate elytra, and by the slightly narrower declivital impression.

Female. - Length 2.0 mm (paratypes $1.5-2.0 \mathrm{~mm}$ ), 2.9 times as long as wide; color brown.

Frons as in minimus except epistomal tubercle distinctly larger and more nearly carinate.

Pronotum and elytra about as in minimus except elytra strongly reticulate, strial punctures more distinctly indicated, declivity less strongly, more narrowly impressed, lateral elevations and ending more remote from costal margin.

Male.-Similar to female except antennal club without long setae on posterior face.

Distribution. - Chiapas to Oaxaca.
MEXICO: Chiapas: 51 km S Valle Nacional, 21-V-71, D. E. Bright; Mt. Tzontehuiz, 12-VI-69, Quercus, D. E. Bright; 13 km E San Cristóbal, 6-VI-69, D. E. Bright. Oaxaca: 51 km S Valle Nacional, 21-V-71, D. E. Bright; 5 km N Suchextepec on Highway I75, 4-VI-71, 2300 m , Salix, D. E. Bright.

Notes.- The above treatment was based on the type series of 66 specimens.

## 8. Microcorthylus minimus Schedl

Microcorthylus minimus Schedl, 1950, Dusenia 1:160 (Syntypes, females; Nova Teutonia, Santa Catarina, Brazil; Schedl and Plaumann colls.)
Microcorthylus minutissimus Schedl, 1952, Dusenia $3: 361$ (Syntypes, Jamaica; Schedl Coll.)
Diagnosis.- This species is distinguished from parvulus Ferrari by the stouter body form, by frontal characters, and by the less extensively impressed declivity, with spine 2 at the middle.

Female.- Length $1.2-1.3 \mathrm{~mm}, 2.5$ times as long as wide; color yellowish brown.

Frons convex, a weak, transverse impression on lower third, a small, pointed median tubercle just above epistomal margin; impressed and lateral areas rugose-reticulate, almost smooth and shining in central area, punctures small, shallow. Antennal club 1.3 times as long as scape, 1.2 times as long as wide; subcircular in outline.

Pronotum 1.15 times as long as wide; essentially as in parvulus.

Elytra 1.3 times as long as wide, 1.2 times as long as pronotum; punctures obscure, almost obsolete; surface subshining, almost smooth except reticulate near declivity. Declivity very steep, rather broadly impressed much as in parvulus, surface with dense, minute, impressed points on lower two-thirds, becoming reticulate toward base; spine 2 at level of middle of declivity.

Male.- Similar to female except antennal club without tuft of hair on posterior face; anterior margin of pronotum armed by six to eight serrations.

Distribution.-aVeracruz to Panama, Jamaica, and Brazil.

MEXICO: Veracruz: 37 km N Matías Romero, 29-V167, No. 130, tree branch, S. L. Wood. HONDURAS: La Ceiba, Atlantida, 26-VIII-49, at light, E. C. Becker; Zamorano, Morazan, 18-IV-64, 70 ) m. No. 546, Acacia pennatula, S. L. Wood. COSTA RICA: Beverley, Limón, 26-VII1-63, 7 m , No. 154, woody vine, S. L. Wood: Dominical, Puntarenas, $9-\lambda I I-63,3 \mathrm{~m}$, No. 298, tree branch, S. L. Wood; Santa Ana, San José, 30-VIII-63. 1300 m , No. 160 , tree seedling. S. L. Wood. PANAMA: Ft. Clayton, Canal Zone, 22-XII-63, 30 m , No. 319, Serjania, S. L. Wood. OTHER AREAS: Jamaica, Brazil.

Biology.- Specimens were taken from stems 2-4 cm in diameter.

Notes.- The above treatment was based on 2 syntypes of minimus and one of minutissimus, and on 59 other specimens.

## 9. Microcorthylus pumilus Wood

Microcorthylus pumilus Wood, 1973, Great Basin Nat. 33:268 (Holotype, female: 9 miles or 15 km SE Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species differs from all preceding forms in having a continuous, submarginal, subacute line extending from the suture along the costal submargin to the lateral margin of the declivity; it is also unique in having a very broad female frons, with the mandibles proportionately lengthened.

Female.- Length $1.7-1.9 \mathrm{~mm}, 2.9$ times as long as wide; color very dark brown.

Frons very broad, particularly below, broadly convex; surface very finely punctured, finely rugose-reticulate to upper level of eyes, smooth and shining above. Antennal club 1.1 times as long as scape, 1.3 times as long as wide; obovate, widest through suture 2; posterior face without a tuft of long hair.

Pronotum 1.2 times as long as wide; sides almost straight and parallel on basal half, very broadly rounded in front; anterior margin weakly serrate; summit indefinite, on anterior third; anterior third finely asperate; posterior areas strongly reticulate, punctures minute, shallow. Glabrous.

Elytra 1.8 times as long as wide, 1.7 times as long as pronotum; sides almost straight and parallel on basal three-fourths, then arcuately converging, almost straight behind on median
two-thirds; strial punctures obscurely indicated, almost obsolete; surface reticulate. Declivity very steep, almost vertical on lower half; rather narrowly sulcate on upper third, broadly impressed below; punctures obsolete, surface reticulate; suture narrowly elevated, lateral margin of this line subacute, continued without interruption along costal submargin to lateral margin of declivity; impressed area somewhat heart-shaped; spines 1 and 2 almost obsolete. Glabrous except for a few hairlike setae near declivity.

Male.-Similar to female except lower frons normal, not as broad; antennal club more slender; anterior margin of pronotum more strongly serrate, with 10 serrations.

Distribution.- Costa Rica and Panama.
COSTA RICA: 15 km SE Cartago. Cartago. 3-V11-63. 1800 m, No. 17B. Conostegia oerstediana, S. L. Wood; Tapantí, Cartago, 2-VII-63, 1300 m , No. 10, C. oerstediana, S. L. Wood. PANAMA: Cerro Punta, Chiriquí, 11-I-64, 1800 m, No. 376, tree branch. S. L. Wood.

Biology.- Specimens were taken from recently cut branches.

Notes.- The above treatment was based on the type series of 13 specimens.

## 10. Microcorthylus pusillus Wood

Microcorthylus pusillus Wood, 1973. Great Basin Nat. 33:269 (Holotype, female; Buenos Aires, Cortéz, Honduras; Wood Coll.)
Diagnosis.- This species is distinguished from pumilus Wood by the larger size, by the very different frons, by the tuft of hair on the posterior face of the female antennal club, and by the larger declivital denticles.

Female.- Length $2.0-2.4 \mathrm{~mm}, 2.9$ times as long as wide; color light reddish brown.

Frons with lateral thirds impressed from epistoma to slightly above eyes, median third strongly elevated, attaining a rather broad summit at a level slightly below upper level of eyes; surface reticulate in impressed areas, smooth and shining on median third and on entire area above eyes. Antennal club 1.2 times as long as wide; a small tuft of hair on posterior face.

Pronotum 1.02 times as long as wide; about as in pumilus; 14 serrations on anterior margin. Glabrous.

Elytra about 1.6 times as long as wide; 1.7 times as long as pronotum; about as in pumilus except lower declivity narrower, and spines 1 and 2 small, but distinctly larger.

Male.-Similar to female except frons broadly, rather evenly convex, with a short median carina on lower fourth, central area very slightly elevated, surface reticulate and with moderately coarse, shallow punctures; serrations on anterior margin of pronotum slightly larger.

Distribution.- Guatemala to Honduras.
guatemala: Volcán Pacaya, 1-VI-64, 1300 m , No. 668 , tree branch, S. L. W'ood. HONDURAS: Buenos Aires, Cortéz, $7-\mathrm{V}-64,2300 \mathrm{~m}$, No. 576B, tree seedling, S. L. Wood.

Biology.- Specimens were taken from branches less than 5 cm in diameter.

Notes.- The above treatment was based on the type series of 10 specimens.

## 11. Microcorthylus lassus Wood

Microcorthylus lassus Wood, 1973, Great Basin Nat. 33:270 (Holotype, female; Tapantí, Cartago, Costa Rica: Wood Coll.)
Diagnosis.- This species is distinguished from all preceding species in this genus by the complete absence of an elevation on the crest of declivital interstriae 1, and by the complete absence of sutures on the male antennal club; suture 1 and the ends of 2 occur in the female antennal club.

Female.- Length $1.5-1.6 \mathrm{~mm}, 2.8$ times as long as wide; color dark brown.

Frons as in pumilus Wood except mandibles normal. Antennal club 1.5 times as long as scape, 1.2 times as long as wide, suture 1 complete, 2 obsolete except at extreme margins.

Pronotum and elytral dise as in pumilus. Elytral declivity essentially as in debilis Wood except interstriae 1 not elevated, its lateral crest entirely obsolete; all punctures obsolete; surface reticulate.

Male.- Similar to female except sutures of antennal club obsolete (one specimen with suture 1 very feebly indicated); anterior margin of pronotum armed by two, basally contiguous, coarse, pointed serrations.

Distribution.- Costa Rica to Panama.
COSTA RICA: Tapantí, Cartago, 17-VIIl-63, 1300 m , No. 106, woody vine, S. L. Wood. PANAMA: Cerro Punta, 11-I-64, 1800 m, No. 388 , tree seedling, S. L. Wood.

Biology.- Specimens were taken from stems $2-4 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of seven specimens.

## 12. Microcorthylus grandiclavatus Eggers

Microcorthylus grandiclacatus Eggers, 1935, Rev. de Ent. 5: 156 (Holotype, male; San José, Costa Rica; lost with Hamburg Mus.; neotype, male, Escasu, San José, Costa Rica; U.S. Nat. Mus., present designation)
Diagnosis.- This species is distinguished from lassus Wood by the larger size, by the presence of a series of tubercles on declivital interstriae 1 , and by the very different female frons.

Female.- Length 1.9-2.0 mm, 2.5 times as long as wide; color dark brown.

Frons broadly convex, with median third convexly elevated, this smooth, shining elevation commencing slightly below upper level of eyes and extending toward vertex; lower and lateral areas rugose-reticulate, with fine, sparse punctures; vestiture fine, sparse, inconspicuous. Antennal club 1.4 times as long as scape, 1.4 times as long as wide; obscurely triangular; suture 1 weakly procurved, 2 straight, widest through distal part of segment 2; without a tuft of hair on posterior face.

Pronotum 1.1 times as long as wide; essentially as in pumilus Wood.

Elytra 1.4 times as long as wide, 1.4 times as long as pronotum; sides feebly arcuate, subparallel on basal two-thirds, broadly rounded behind, narrowly, rather shallowly emarginate at suture, punctures obscure, confused, almost obsolete; surface reticulate. Declivity very steep; excavation similar to but deeper than in lassus; surface reticulate, punctures obscure except striae 1 on middle half of declivity with about four to eight moderately coarse punctures, dorsomedian margin of each puncture armed by a small tubercle; upper half of lateral margin armed by two pairs of small spines as in other species. Vestiture sparse, inconspicuous.

Male.- Similar to female except frons almost evenly convex, a small, median, subtuberculate carina at epistomal margin, surface entirely rugose-reticulate; anterior margin of pronotum with several serrations, median pair usually conspicuously larger; posterior third of elytral dise almost smooth, more brightly shining, tubercles on declivital striae 1 conspicuously larger, spines 1 and 2 on lateral margin slightly larger.

Distribution.- Costa Rica to Panama.
COSTA RICA: Escasú, San José, 2-X-63, 1300 m , No. 218, tree seedling, S. L. Wood. PANAMA: Cerro Punta, Chiriquí, 1I-I-64, 1800 m , No. 424, tree branch, S. L. Wood.

Biology.- Specimens were taken from stems $2-5 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on 70 specimens.

The holotype was lost in the destruction of the Hamburg Museum. Because only one species in this easily recognized South American species group occurs in Central America, from Costa Rica, and because this species is easily recognized from the description, a male was selected from the Escasú (a suburb of San José) series and is here designated as the neotype of grandiclavatus Eggers. The neotype fits the original description of this species precisely except that a second pair of serrations on the anterior margin of the pronotum are almost as large as the median pair. It was selected because it exhibited other characters more clearly than did other males in the series.

## 13. Microcorthylus concisus Wood

Microcorthylus concisus Wood, 1973, Great Basin Nat. 33:270 (Holotype, female: Volcán, Puntarenas, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from grandiclavatus Eggers by the smaller size, by the uniformly convex female frons, and by the less strongly impressed elytral declivity.

Female.- Length $1.6-1.8 \mathrm{~mm}, 2.6$ times as long as wide; color dark brown.

Frons broadly convex, a slight transverse impression just above epistoma, a short, weak, median carina at epistomal margin; central area almost smooth, lower and lateral areas rugose-reticulate, punctures fine in smooth area, slightly coarser elsewhere. Antenna about as in grandiclavatus.

Pronotum and elytra as in grandiclavatus except declivity less strongly impressed; punctures and tubercles on declivital striae 1 smaller, varying in number from zero to four.

Male.- Similar to female except frons uniformly rugose-reticulate; anterior margin of pronotum serrate, one or two median pairs larger; elytra obscurely to weakly reticulate; tubercles on declivital striae 1 larger, strial punctures almost or entirely obsolete.

Distribution.- Costa Rica.
COSTA RICA: San Ignacio de Acosta, San José, 5-VII$63,1500 \mathrm{~m}$, No. 35 , Croton gossypiifolius, S. L. Wood; Volcán. Puntarenas, 11-XII-63, 1000 m , No. 304, tree branch, S. L. Wood.

Biology.- Specimens were taken from branches $2-5 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 17 specimens.

## 14. Microcorthylus vescus Wood

Microcorthylus tescus Wood, 1973, Great Basin Nat. 33:271 (Holotype, female; Volcán Zunil, Quezaltenango, Guatemala; Wood Coll.)
Diagnosis.- This species is distinguished from concisus Wood by the larger size, by the absence of a median epistomal carina, by the more nearly strigose punctures on the frons, and by the strongly reticulate male elytra.

Female.- Length $2.0-2.3 \mathrm{~mm}, 2.5$ times as long as wide; color brown.

Frons as in concisus except epistomal tubercle not at all carinate; punctures and impressed points slightly larger and more nearly longitudinally strigose.

Pronotum and elytra as in concisus except punctures on declivital striae 1 obsolete, accompanying tubercles minute.

Male. - Similar to female except frons more uniformly rugose-reticulate; anterior margin of pronotum serrate; elytral disc strongly reticulate to declivity (also in female); tubercles and punctures on declivital interstriae 1 larger, but smaller than in grandiclavatus Eggers.

Distribution.- Guatemala.
guatemala: Voicán Zunil, Quezaltenango, 27-V$64,1000 \mathrm{~m}$, No. 628 , tree seedling, S. L. Wood.

Notes.- The above treatment was based on the type series of 26 specimens.

## Genus CORTHYCYCLON Schedl

Corthycyclon Schedl, 1951, Dusenia 2:128 (Type-species: Corthycyclon ustum Schedl, monobasic)
Diagnosis.- This genus is distinguished from Corthylus Erichson by the club-shaped antennal scape, by the complete absence of sutures on the antennal club, by the subinflated, tuberculate posterior face of the female protibia, and by the apical fringe of hair on the female antennal club.

Description.- Length 1.3-2.4 mm, 2.1-2.6 times as long as wide; color very dark brown or bicolored.

Frons sexually dimorphic, male convex, subglabrous, female concave from eye to eye from epistoma to vertex, sculpture and ornamentation by hair simple. Eye emarginate, finely granulate. Antennal scape slender, club-shaped; funicle 1 -segmented, club aseptate, sutures not indicated, female club larger and ornamented by long hair on apical margin. Scutellum large, flat. Elytral dise with punctures obscure, in rows or confused; declivity convex, conservatively sculptured. Female protibia subinflated and finely tuberculate on posterior face.

Distribution.- Puebla to Brazil; six species are known from Mexico and Central America; a larger number of species occurs in South America.

Biology. - These monogamous species breed in recently cut or broken small branches of trees, shrubs, and woody vines (lianas) about $1-4 \mathrm{~cm}$ in diameter. The gallery systems are as in Corthylus. They usually occur at elevations higher than 2000 m .

Notes.- Most of the South American species that belong to this genus were described in other genera and have not yet been transferred here. The features that distinguish it from Brachyspartus and Corthylus have not been clearly defined; it is entirely possible that these genera will intergrade in South America.

## Key to the Species of Corthycyclon

1. Elytral declivity reticulate, punctures largely obsolete, interstriae 1 abruptly, moderately elevated; if present, granules minute and restricted to interstriae 3; female antennal club compact, 1.4-1.5 times as long as wide

- Elytral declivity shining, contours variously irregular, punctures in strial rows usually evident, interstriae 1 feebly if at all elevated, interstrial granules usually conspicuous on several interstriae; female antennal club elongate, 1.8-2.5 times as long as wide (except 1.2 in morulum)

2(1). Female frons planoconcave, punctures very fine, largely obsolete; body 2.3 times as long as wide; declivital interstriae 3 with a row of very fine granules; Costa Rica; 2.0-2.1 mm 1. caliginis Wood

- Female frons moderately concave, punctures rather fine, distinct, moderately abundant; body 2.1 times as long as wide; declivital interstriae 3 with a row of subgranulate punctures; Costa Rica; 1.3-1.6 mm

2. furvum Wood

3(1). Declivital interstriae 2 feebly impressed and unarmed by granules, 1 and 3 each with a row of fine granules; female antennal club 1.2 times as long as wide; Costa Rica; 2.1 mm 3. morulum Wood

- Declivital interstriae 1-3 about equal in height and armed by granules; female antennal club 1.8-2.5 times as long as wide
4(3). Female antennal club widest on basal third, apex acutely pointed; declivital vestiture sparse, consisting of one long hair arising from each granule; declivity very steep, very broadly convex; Panama; 2.25 mm

4. ebeninum (Blandford)

- Female antennal club narrowly rounded at apex, not acutely angled; declivity moderately steep, more strongly convex, its vestiture more abundant
5(4). Declivity with strial punctures very small, in rows, granules minute, not clearly evident, vestiture of moderately abundant short hair and sparse much longer hair (presumably on alternate interstrial rows); female antennal club subacuminately tapered from near basal third to apex; Costa Rica to Panama; $1.5-1.7 \mathrm{~mm}$

5. tardum Wood

- Strial punctures on declivity mostly obsolete, granules clearly evident, long hair more abundant than short hair; female antennal club obtusely tapered from middle; Puebla to Costa Rica; 1.8-2.4 mm $\qquad$ 6. aztecum (Bright)

## 1. Corthycyclon caliginis Wood Fig. 219

Corthycyclon caliginis Wood, 1974. Great Basin Nat. 34:148 (Holotype, female; 16 km SE Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from others in the genus by the size, by the rather strongly, continuously elevated declivital interstriae 1 , with 2 moderately impressed, and by the absence of punctures and tubercles on the declivity.

Female.- Length $2.0-2.1 \mathrm{~mm}, 2.3$ times as long as wide; color almost black.

Frons feebly concave from eye to eye from epistoma to vertex, surface reticulate except almost smooth on lower median area, punctures small to minute, shallow, not clearly impressed; vestiture of very fine, moderately long hair of uniform distribution, slightly longer at margins. Antennal club 1.5 times as long as wide; a small tuft of hair at apex.

Pronotum 1.04 times as long as wide; sides almost straight and parallel on basal half, rather narrowly rounded in front; anterior margin armed by a pair of slender, median teeth; summit indefinite, slightly behind middle; anterior half closely asperate; posterior half reticulate, reticulation also extending between asperities on anterior half, punctures small, moderately abundant, those near base of disc finely tuberculate on their posterior margins. Pubescence of fine, short, moderately abundant hair.

Elytra 1.4 times as long as wide, 1.5 times as long as pronotum; sides almost straight and parallel on basal two-thirds, rather broadly rounded behind; disc subshining, surface with obscurely impressed lines and other minute irregularities; punctures obsolete on posterior half, very small and confused on basal half. Declivity steep, convex, except moderately sulcate on interstriae 2,1 uniformly elevated from base to near apex; surface reticulate, punctures and granules obsolete. Vestiture largely confined to posterior third of elytra, of fine, short, confused hair.

Male.-Similar to female except frons moderately convex, strongly reticulate, with
fine punctures, subglabrous; antennal club without apical tuft of hair.

Distribution.- Costa Rica.
COSTA RICA: 16 km SE Cartago, Cartago, 24-IX-63, 1800 m . No. 196, woody vine, No. 195, tree seedling, S. L. Wood.

Biology.- Specimens were taken from stems $1-2 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of four specimens.

## 2. Corthycyclon furvum Wood

Corthycyclon furcus Wood, 1974, Great Basin Nat. 34:148 (Holotype, female; Peralta, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from caliginis Wood by the smaller size, by the stouter body form, by the more deeply concave female frons, and by the row of subgranulate punctures on declivital interstriae 3.

Female.- Length $1.3-1.6 \mathrm{~mm}, 2.1$ times as long as wide; color almost black.

Frons as in caliginis except rather deeply concave, rather strongly reticulate over entire surface, punctures moderately coarse, most of them distinctly impressed. Pronotum and elytra as in caliginis except declivity more finely, more uniformly reticulate and interstriae 3 with a row of subreticulate punctures.
Male.-Similar to female except sexual differences as in caliginis.

Distribution.- Costa Rica.
COSTA RICA: Peralta, Cartago, 10-III-64, 500 m , No. 461, woody vine, S. L. Wood; Tapantr,' Cartago, 24-X$63,1300 \mathrm{~m}$, woody vine, S. L. Wood.

Biology.- Specimens were taken from woody vines (lianas) $1-2 \mathrm{~cm}$ in diameter.
Notes.- The above treatment was based on the type series of five specimens.

## 3. Corthycyclon morulum Wood

Corthycyclon morulum Wood, 1974, Great Basin Nat. 34:149 (Holotype, female; 16 km SE Cartago. Cartago, Costa Rica: Wood Coll.)
Diagnosis.- This species is distinguished by the compact antennal club and by the
characters of the elytral declivity indicated below.

Female.- Length $2.1 \mathrm{~mm}, 2.5$ times as long as wide; color almost black.

Frons essentially as in furvum Wood except surface subreticulate, punctures rather fine, abundant, distinct, vestiture of very fine hair. Antennal club 1.2 times as long as wide.

Pronotum and elytra essentlaly as in caliginis Wood except pronotal dise more coarsely punctured and interstriae 2 rather weakly impressed and without granules, 1 distinctly, moderately elevated, 1 and 3 each armed by a row of small, rounded, rather widely spaced granules. Vestiture sparse, confined to odd-numbered declivital interstriae, fine, rather short.

## Distribution.- Costa Rica.

COSTA RICA: 16 km SE Cartago, Cartago, 3-vil-63, 1800 m, No. 18, Conostegia oerstediana, S. L. Wood.

Biology.- The species was taken from a recently cut branch $1-2 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the unique holotype.

## 4. Corthycyclon ebeninum (Blandford)

Brachyspartus cbeninus Blandford, 1904, Biol. Centr. Amer., Coelopt. 4(6):265 (Holotype, female; Volcán de Chiriquí, Chiriquí, Panama; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished by the strongly acuminate female antennal club and by the very steep, broadly convex elytral declivity.

Female. - Length $2.25 \mathrm{~mm}, 2.5$ times as long as wide; color black.

Frons as in morulum Wood except median fifth on lower half impunctate and glabrous, punctures on remaining area slightly larger. Antennal club 2.0 times as long as wide, widest on basal third, apex acutely pointed.

Pronotum 1.1 times as long as wide; sides straight and parallel on basal half, rather broadly rounded in front; anterior margin serrate; indefinite summit in front of middle; asperities on anterior slope not as close or as high as in other species of this genus; posterior areas smooth, shining, punctures very small, distinct. Glabrous.

Elytra 1.5 times as long as wide, 1.3 times as long as pronotum; sides straight and parallel on basal three-fourths, very obtusely subangulate behind; surface almost smooth, shining, a few obscure lines, punctures minute, largely confused. Declivity very steep, very broadly convex; strial punctures minute, in irregular rows; suture feebly elevated, interstriae each with a row of very small, rounded granules; posterolateral margin weakly, subacutely elevated from near sutural apex toward interstriae 8. Vestiture of long hairs arising from declivital granules.

## Distribution.- Panama.

PANAMA: Volcán de Chiriquí, Chiriquí, 4-6000 ft, G. C. Champion.

Notes.- The above treatment was based on the holotype.

## 5. Corthycyclon tardum Wood

 Fig. 219Corthycyclon tardus Wood, 1974, Great Basin Nat. 34:149 (Holotype, female; 16 km SE Cartago, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from aztecum (Bright) by the smaller size, by the smaller declivital granules, by the more abundant short and sparse long declivital hair, and by the female antennal club.

Female.- Length $1.5-1.7 \mathrm{~mm}, 2.5$ times as long as wide; color dark brown.

Frons about as in morulum Wood except obscurely reticulate, punctures smaller, median half of epistomal margin transversely carinate. Antennal club 2.5 times as long as wide, tapered from basal third to apex; apex ornamented by a tuft of about two or three long hairs.

Pronotum and elytral dise as in morulum except pronotal disc with punctures minute, almost obsolete. Elytral declivity steep, convex; interstriae 1 feebly if at all elevated, strial punctures minute to obsolete; surface shining; with numerous very minute, confused punctures, those bearing short hair often minutely granulate, particularly near base of declivity, interstriae 1 and 3 each bearing a few slightly larger granules at bases of longest setae. Vestiture confined to declivity, of moderately abundant fine, short hair and sparse rows of long hair on odd-numbered interstriae.

Male.-Similar to female except frons convex, reticulate, sparsely punctured, subglabrous; antennal club less than twice as long as wide, without long hair.

Distribution.- Costa Rica to Panama.
COSTA RICA: 16 km SE Cartago, Cartago, 24-1X-63. 1800 m , No. 197, Siparuna nicaraguensis, S. L. Wood; Volcán Poás, Heredia, 6-IX-63, 2500 m , No. 169, Vaccinium consaguineum, S. L. Wood. PANAMA: Cerro Campana, 26-V11-66, 1006 m , No. 33. Cecropia petiole, S. L. Wood.

Biology.- Specimens were taken from stems $1-2 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of nine specimens.

## 6. Corthycyclon aztecum (Bright)

Fig. 219
Corthylus aztecus Bright, 1972, Canadian Ent. 104:1374 (Holotype, female; 5.6 km or 3.5 miles S Suchixtepec, Oaxaca, Mexico; Canadian Nat. Coll.)
Diagnosis.- This species is distinguished from tardum Wood by characters mentioned in the above key and in the following description.

Female.- Length $1.8-2.4 \mathrm{~mm}, 2.6$ times as long as wide; newly emerged specimens bicolored, with anterior half of pronotum and posterior half of elytra dark brown, remaining areas yellowish brown, older specimens uniformly dark brown.

Frons as in tardus except punctures very small, hair on margins much longer than that in concave area. Antennal club 1.8 times as long as wide, arcuately tapered from middle to apex; tuft of hair arising from margin of apical third.

Pronotum and elytra as in tardum except declivital granules larger on all interstriae (variable). Vestiture largely confined to
declivity, of sparse short hair and slightly more abundant long hair; long hair on all interstriae.

Male.-Similar to female except sexual differences as in tardum.

Distribution. - Puebla to Costa Rica.
MEXICO: Chiapas: 13 km NE San Cristóbal de las Casas, 15-V-69, D. E. Bright. Puebla: 9 km NE Teziutlán, $1600 \mathrm{~m}, 27-\mathrm{VI}-53,2-\mathrm{VII}-67$, No. 148, Miconia, S. L. Wood. Oaxaca: 5.6 km S Suchixtepec, 2-VI-71, 2600 m, D. E. Bright. COSTA RICA: 16 km SE Cartago, Cartago, 24-IX-63, 1800 m , No. 196, woody vine, No. 199, Siparuna nicaraguensis, No. 202, Miconia dodecandra, S. L. Wood; Volcán Irazu, Cartago, 28-VI-63, 2700 m , No. 2, Bocconia frutescens, No. 4, Oreopanax xalapense, S. L. Wood; Volcán Poas. Heredia, $6-1 \mathrm{~L}-63,1300 \mathrm{~m}$, No. 169, Vaccinium consanguincum, S. L. Wood; Cerro de la Muerte, San José, l-VlIl-66, 3000 m , No. 46, woody vine, S. L. Wood.

Brology.- This species was taken from stems $1-3 \mathrm{~cm}$ in diameter.

Notes. - The above treatment was based on the holotype, on 2 paratypes, and on 105 other specimens.

The elytral declivity of this species is variable within and between series. In most specimens the strial punctures are obsolete and the interstrial tubercles are in definite rows. In others, small strial punctures are present, some or all of which may be finely to rather coarsely tuberculate. In part of the type series part of the tubercles on interstriae 2 were absent. In the material at hand I see no clines or other means of subdividing this species.

## Genus Corthylocurus Wood

Corthylocurus Wood, 1966, Great Basin Nat. 26:18
(Type-species: Brachyspartus barbatus Blandford. original designation)
Diagnosis.- This genus is distinguished from Corthylus Erichson by a combination of characters: the distintive female frons, the antennal club that has two almost straight sutures and a different tuft of hair on the posterior face in the female, the inflated and tuberculate posterior face of the female protibia, and the somewhat different elytral declivity.

Description.- Length $1.5-2.8 \mathrm{~mm}$, 2.1-2.5 times as long as wide; color yellowish brown to light brown.

Frons sexually dimorphic, male convex, female longitudinally bi- or trisulcate to deeply
concave and with a pair of conspicuous longitudinal, carinae. Eye emarginate; rather coarsely faceted. Scape slender, club shaped; funicle 1 -segmented; club large, flat, with two straight or feebly procurved sutures, posterior face with a tuft of hair arising from at least one-third of surface near apex. Pronotum about as in Corthylus. Scutellum large, flat. Elytra with punctures confused or in strial rows; declivity weakly to strongly sulcate, conservatively sculptured. Female protibiae modestly inflated, with several small, confused tubercles.

Distribution.- Nayarit and Puebla to Brazil; six species occur in North and Central America; a larger number of species occurs in South America, but most of them have not yet been transferred to this genus.

Biology.- These monogamous species breed in small branches where they construct tunnels similar to those of Corthylus, although the spiral galleries predominate.

A peculiar habit was noted in some specimens of barbatus (Blandford) and in two unnamed similar South American species. The barbatus entrance hole was located $5-10 \mathrm{~mm}$ above or below the entrance hole of Corthylus concisus. Wood. After the gallery systems of both species were nearly complete, but before oviposition commenced, the barbatus female bored into the Corthylus gallery and either evicted or apparently killed the Corthylus, then plugged the Corthylus entrance hole with frass and produced brood in both systems of tunnels. Because the spacing of the entrance holes was abnormally close in dozens of instances, this appeared to be a normal habit of at least some species in this genus.

Notes.- A thorough review of South American Corthylini might indicate the necessity of combining this distinctive group of species with Corthylus. Nevertheless, as presently understood it appears to have an independent origin sufficiently remote to justify separate generic status. Five additional species were taken in Venezuela and at least four others have been named in various genera from other South American localities, thus suggesting that much more remains to be learned about this genus.

## Key to the Species of Corthylocurus

1. Female frons longitudinally bi- or trisulcate, vertex not ornamented by a dense tuft of long hair; male declivity without an acutely elevated posterolateral margin diverging from costal margin; smaller species2

- Female frons rather deeply concave from eye to eye from epistoma to vertex, epistoma bearing a pair of curls of long hair, vertex ornamented by a dense brush of long plumose hair; male declivity with an acutely elevated posterolateral margin extending from costal margin near sutural apex toward interstriae 8; larger species5

2(1). Smaller species; elytral disc shining, strial punctures minute, in distinct rows; female frons less strongly impressed to upper level of eyes or less, sulci and carinae obscurely developed, vestiture mostly very short and more generally distributed3

- Larger species; elytral disc with punctures larger, confused at least on basal half; female frons with sulci strongly to very strongly impressed to upper level of eyes or higher, carinae rather strongly, subacutely developed, vestiture in approximate rows or greatly reduced in distribution

3(2). Frons narrow, 1.3 times as wide as long; impressed area on female frons ending well below upper level of eyes, lateral areas shallowly impressed and ornamented by very short, stout setae over entire impressed area, narrow median line weakly elevated, shining, very narrowly divided throughout its length by a fine, impressed, median line; declivital interstriae 3 with granules almost obsolete; Costa Rica to Panama; 1.5 mm

Frons rather broad, 1.7 times as wide as long; impressed area on female frons feebly indicated and glabrous on lateral thirds to upper level of eyes, sulcus on median sixth moderately deep, glabrous, with longitudinal carinae on its margins feebly elevated and marked at dorsal end by a small rounded tubercle, carinae bearing numerous very short, stout setae; granules on declivital interstriae 3 minute; Nayarit to Morelos; 1.8-1.9 mm
2. aguacatensis (Schedl)

4(2). Body rather slender, 2.5 times as long as wide; elytral disc shining, strial punctures essentially in rows on posterior half; female lateral frontal sulci glabrous, extending to slightly above eyes, carinae subparallel, dividing frons into almost equal thirds, entire length of margins of carinae with moderately long hair; declivity narrowly, rather weakly bisulcate, granules on interstriae 3 very small; Veracruz to Panama; $1.8-2.0 \mathrm{~mm}$
3. mexicanus (SchedI)

- Body stout, 2.1 times as long as wide; elytral disc reticulate, punctures confused; female frons with strongly impressed, glabrous lateral sulci extending well above eyes, carinae on lower half on strongly elevated median fourth, subcontiguous, moderately diverging above, lower end of median elevated area ornamented by a dense tuft of rather short setae, a small, similar tuft of hair on each mandible; declivity moderately, rather broadly sulcate, lateral convexities armed by two pairs of small, pointed tubercles; Costa Rica; 1.5-1.8 mm

4. costaricensis (Schedl)

5(1). Female frons slightly less strongly concave, median pair of parallel carinae abruptly, rather strongly elevated from slightly above epistomal area to vertex, paired curls of hair on epistoma larger, longer, reddish; declivital sulcus narrower, not as deep, tubercles on lateral margins smaller; Chiapas to Costa Rica; $2.0-2.2 \mathrm{~mm}$

- Female frons more strongly convex, median carina largely obsolete on lower half, dividing slightly above middle into low, diverging carinae to vertex, paired curls of hair on epistoma smaller, shorter, yellow; declivital sulcus deeper, wider, tubercles on lateral convexities slightly larger; Puebla to Panama; $2.1-2.5 \mathrm{~mm}$

6. barbatus (Blandford)

## 1. Corthylocurus debilis Wood

 Fig. 220Corthylocurus debilis Wood, 1974, Great Basin Nat. 34:150 (Holotype, female; Beverley, Limón, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from aguacatensis (Schedl) by the characters of the female frons and elytral declivity as indicated below.

Female.- Length $1.5 \mathrm{~mm}, 2.4$ times as long as wide; color yellowish brown.

Frontal area narrow for this genus, 1.3 times as wide as long, somewhat shallowly, biconcavely impressed on quadrate area from epistoma to about three-fourths distance to upper level of eyes; narrow median line sharply impressed, its lateral margins shining, weakly elevated, lateral impressed area covered by rather dense, very short, stout setae, those near median line apparently on a spongy area; upper areas convex, reticulate, glabrous. Antennal club large, broadly obovate, 1.2 times as long as wide; tuft of hair on posterior face very poorly developed.

Pronotum and elytra as in aguacatensis except elytral declivity more brightly shining, very feebly sulcate, and granules on interstriae 3 obsolete.

Male.- Similar to female except frons convex and devoid of special sculpture, reticulate, sparsely punctured, subglabrous; anterior margin of pronotum armed by six serrations, median pair much longer.

Distribution.- Costa Rica to Panama.
COSTA RICA: Beverley, Limón, 26-VIII-63, 7 m , No. 154, woody vine, S. L. Wood. PANAMA: Ft. Clayton, Canal Zone, 22-XII-63, 30 m , No. 3I9, Seriania, S. L. Wood.

Biology.- Specimens were taken from woody vines 1 cm in diameter.

Notes.- The above treatment was based on the holotype and allotype.

## 2. Corthylocurus aguacatensis (Schedl) Fig. 220

Metacorthylus aguacatensis Schedl, 1940, An. Esc. Nac. Cienc. Biol., Mexico 1:357 (Syntypes; Xochitlán, Morelos; Mexico; Schedl and Dampf colls.)

Diagnosis.- This species is distinguished from debilis Wood by the larger size and by the characters of the female frons and declivity indicated below.

Female.- Length $1.8-1.9 \mathrm{~mm}, 2.5$ times as long as wide; color yellowish brown.

Frons similar to debilis except lateral areas less distinctly concave, extending to upper level of eyes; median sulcus occupying median fifth of area between eyes to upper level of eyes, much deeper spongy areas on its margins weakly elevated and larger and more conspicuous than in debilis, their upper limits marked by a pair of small tubercles; median half of lateral impressed area with abundant, very short, stout setae as in debilis, its lateral half glabrous, several long setae at point of transition.

Pronotum 1.1 times as long as wide; sides almost straight and parallel on basal half, rather narrowly rounded in front; anterior margin with about 10 weak, contiguous serrations; summit indefinite, anterior to middle; anterior slope with coarse, low asperities; entire surface reticulate except for asperities; punctures on posterior areas obsolete. Glabrous.

Elytra 1.4 times as long as wide, 1.3 times as long as pronotum; sides almost straight and parallel on basal two-thirds, rather broadly rounded behind; disc almost smooth, shining, punctures minute, mostly distinct, in strial rows. Declivity convex, steep; sutural interstriae feebly elevated, interstriae 3 with about three fine, rounded granules; strial punctures minute, very obscurely indicated; surface subreticulate. Vestiture confined to declivity, of very sparse, rather short, stout, interstrial hair.

Male.-Similar to female except sexual differences as in aguacatensis.

Distribution.- Nayarit to Morelos.
MEXICO: Michoacán: Putuan, 1-XI-80, Spondia mombin, T. H. Atkinson. Morelos: Xochitlán, VIII-37, M. F. 6130A, en troncos de aguacate. Nayarit: 6 km W Tepic, 13-VII-65, 1000 m , No. 240, tree branches, S. L. Wood.

Biology.- My specimens were taken from branches $1-2 \mathrm{~cm}$ in diameter. The record from the bole of avocado quoted by Schedl in the original description is an obvious error unless very small seedlings were involved.

Notes.- The original description mentions only the male but appears to apply to the
female. The Schedl collection contains a male "holotype" and a female "holotype," although the original description indicates the type series was syntypic. Both of Schedl's "holotypes" were compared directly to my male and female on which the above treatment was based. Ten specimens were examined.

Fig. 220. Corthylocurus spp., female heads and declivities: A, B, debilis; C, D, aguatatensis; E, F, costaricensis; G. H, mexicanus; I , cincinnatus; $\mathrm{J}, \mathrm{K}$, barbatus.

## 3. Corthylocurus mexicanus (Schedl)

 Fig. 220Brachyspartus mexicanus Schedl, 1950, Dusenia 1:163 (Holotype, male; Comitán, Chiapas, Mexico; Schedl Coll.)
Corthylus cylindricus Schedl, 1963, Ent. Arb. Mus. Frey 14:164 (Holotype, female; Jalapa, Veracruz, Mexico; Schedl Coll.); Wood, 1974, Great Basin Nat. 34:279. Synonymy
Corthylus anomalus Bright, 1972, Canadian Ent. 104:1378 (Holotype, female; 5.6 km or 3.5 miles S Suchixtepec, Oaxaca, Mexico; Canadian Nat. Coll.); Wood, 1973, Great Basin Nat. 33:175. Synonymy
Diagnosis.- This species is distinguished from aguacatensis (Schedl) by the characters of the female frons and elytral declivity mentioned below, and by the more confused punctures on the basal half of the elytral disc.
Female.- Length $1.9-2.0 \mathrm{~mm}, 2.5$ times as long as wide; color yellowish brown.

Frons from epistoma to slightly above upper level of eyes rather deeply, equally divided into three longitudinal sulci by a pair of rather strongly elevated, parallel, subacute, longitudinal carinae; lateral sulci smooth, shining, glabrous; median sulcus obtusely angulate at its deepest point; carinae each with a row of moderately long hair on both lateral and mesal margins; head above eyes reticulate. Antennal club moderately asymmetrical; but essentially as in debilis Wood.

Pronotum and elytra as in aguacatensis except punctures on basal half of elytral disc confused and elytral declivity moderately, rather narrowly sulcate, interstriae 2 narrowly, rather deeply impressed, lateral convexities higher than suture and armed by granules as in aguacatensis.

Male.-Similar to female except sexual differences as in debilis.

## Distribution.- Veracruz to Panama. <br> MEXICO: Chiapas: Comitán. Oaxaca: 5.6 km S Such-

 ixtepec, 2-VI-71, 2600 m , Arbutus, D. E. Bright. Puebla: 9 km NE Teziutlán, 2-VII-67, 1600 m , woody vine, No. 137 in Miconia, No. 142 in Rubus, S. L. Wood. Veracruz: 25 km NW Jalapa, 29-VI-53, 2100 m , S. L. Wood; Jalapa. GUATEMALA: Palín, Esquintla, I9-V-64, 300 m , No. 538, anonillo, S. L. Wood; Volcán de Agua, Esquintla, 19-V-64, 1000 m , No. 615 in Acacia, No. 592 in tree branch, S. L. Wood; Volcán Pacaya, I-VI-64, 1300 m, No. 660, tree branch, S. L. Wood. COSTA RICA: 7 km SE Cartago, Cartago, 3-VII-63, 1500 m , No. 14, Rhus. S. L. Wood; San Ignacio de Acosta, San José, 5-VII-63, 1500 m, No. 28, tree branch, S. L. Wood; Santa Ana, San José, 9-X-63, 1300 m , No. 229, tree branch, S.L. Wood. PANAMA: Volcán de Chiriquí, Chiriquí, Il-1$63,1600 \mathrm{~m}$, No. 315 in Inga, No. 376 in tree branch, No. 385 in woody vine, S. L. Wood.

Biology.- Specimens were taken from stems $1-2 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotypes of mexicanus, cylindricus, and anomalus and on 49 other specimens.

## 4. Corthylocurus costaricensis (Schedl)

Fig. 220
Microcorthylus costaricensis Schedl, 1936, Arch. Inst. Biol. Veg., Río de Janeiro 3:108 (Holotype, female; Turrialba, Cartago, Costa Rica; Schedl Coll.)
Diagnosis.- This species is distinguished from other representatives of the genus by the stout body form, by the unique female frons, and by the strongly impressed elytral declivity.

Female.- Length 1.5-1.8 mm, 2.1 times as long as wide; color brown.

Frons with lateral thirds very strongly sulcate from epistoma to vertex, glabrous; median fourth strongly elevated, its summit deeply, abruptly sulcate, sulcus with a very narrow, acute carina, its height not attaining level of lateral margins of sulcus, sulcus dilates and disappears on vertex; carina terminates before sulcus ends; lower end of median elevation ornamented by a dense brush of rather short, subplumose setae; each mandible with a similar tuft of setae. Antennal club subtriangular, wider than long.

Pronotum 1.1 times as long as wide; similar to aguacatensis except more finely sculptured and anterior margins more narrowly rounded.

Elytra 1.1 times as long as wide, 1.05 times as long as pronotum; sides almost straight and parallel on basal two-thirds, very broadly rounded behind, disc strongly reticulate, obscure punctures confused. Declivity very steep, strongly, subtriangularly sulcate somewhat as in Microcorthylus; surface reticulate, obscure punctures confused; lateral convexities on upper half much higher than suture, rounded, armed by two pairs of small, pointed denticles, 1 near base, 2 at middle of declivity and more widely spaced than 1. Subglabrous.

Male.-Simliar to female except sexual differences as in debilis.

Distribution.- Costa Rica.

COSTA RICA: Turrialba, Cartago, 800 m , Schild; Puerto Viejo, Heredia, I2-III-64, 70 m, No. 477, woody vine, S. L. Wood; Finca Gromaco on Río Coto Brus, Puntarenas, I4-VII-63, 500 m , No. 64, woody vine, S. L. Wood; Río Tempisque, Guanacaste, 25-III-64, 15 m , No. 503, woody vine, S. L. Wood.

Biology.- Specimens were taken from stems $1-3 \mathrm{~cm}$ in diameter.

Notes. - The above treatment was based on the holotype and on 42 other specimens.

## 5. Corthylocurus cincinnatus Bright

 Fig. 220Corthylocurus cincinnatus Bright, 1972, Canadian Ent. 104:I379 (Holotype, female; 21 km or 13 miles N Ocozoautla, Chiapas, Mexico; Canadian Nat. Coll.)
Diagnosis.- This species is distinguished from barbatus (Blandford) by characters on the female head and on the elytral declivity as described below.

Female.- Length $2.0-2.2 \mathrm{~mm}, 2.3$ times as long as wide; color yellowish brown.

Frons as in barbatus except less deeply concave, lateral margins on lower half straight and moderately converging orad, median carinae on upper two-thirds of concave area parallel, abruptly, strongly elevated, not diverging from one another near vertex, subglandular area on margins of lower half forming a narrow band (one-eighth as wide as greatest width of concave area) along mesal side of lateral margin from just above upper level of eye to base of epistomal curl of hair, their appearance shiny, not spongy; epistoma with a pair of thick curls of very long reddish hair; upper margin of concave area ornamented by a brush of long, plumose, yellow hair.

Pronotum and elytra as in barbatus except elytral declivity slightly more narrowly, less strongly sulcate, and lateral denticles smaller.

Male.-Similar to female except sexual differences as in barbatus.

Distribution.- Chiapas to Costa Rica.
MEXICO: Chiapas: 2 Ikm N Ocozoautla, 2-VII-69, D. E. Bright. COSTA RICA: Tapantí, Cartago, 17-vili-63, $\mathrm{I} 300 \mathrm{~m}, \mathrm{No} .106$, woody vine, S. L. Wood.

Biology. - Specimens were taken from stems $1-2 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotype and on 12 other specimens.

## 6. Corthylocurus barbatus (Blandford)

 Fig. 220Brachyspartus barbatus Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):265 (Holotype, female; Volcán de Chiqiruí, Chiriquí, Panama; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from cincinnatus Bright by the characters on the female frons and on the elytral declivity mentioned below.

Female.- Length 2.1-2.5 mm, 2.4 times as long as wide; color yellowish brown.

Frons very deeply, subcircularly concave from eye to eye from epistoma to vertex, lateral margins arcuate, one feebly elevated median carina on middle third; it then divides into two distinct diverging carinae to vertex (height and point of divergence variable within series); subglandular area appearing spongy and occupying lateral fifth of concave area from well above eye to base of epistomal curl, extending to median line near base of curl in some specimens; epistomal curl about half as thick as in cincinnatus and conspicuously shorter, of yellow hair; brush of plumose hair on vertex slightly longer than in cincinnatus and more extensive. Antennal club 1.5 times as long as wide, asymmetrically oval; tuft of hair on posterior face poorly developed.

Pronotum 1.1 times as long as wide; essentially as in debilis Wood.

Elytra 1.3 times as long as wide, 1.2 times as long as pronotum; sides alınost straight and parallel on basal two-thirds, broadly rounded behind; disc rather weakly reticulate, punctures small, shallow, poorly formed, confused. Declivity steep, rather strongly sulcate; sulcus deeper and wider than in cincinnatus; sutural interstriae feebly elevated, 2 narrowly impressed above, very broadly impressed below, lateral convexities rounded, much higher than suture, crest armed by two to six tubercles (two usually dominant), tubercles slightly larger than in cincinnatus.

Male.-Similar to female except sexual differences as in debilis; in addition, posterolateral margin of declivity weakly, acutely elevated from sutural apex toward interstriae 8; declivital sulcus less strongly impressed, lateral denticles usually slightly smaller.

Distribution.- Puebla to Panama.

MEXICO: Oaxaca: 9 km S Valle Nacional, 8-V-71, D. E. Bright. Puebla: 9 km NE Teziutlán, 2-V11-67, 1600 m , No. 137, Miconia, No. 149, tree branch, S. L. Wood. COSTA RICA: Escasú, San José, 2-X-63, 1300 m , No. 216, Spondias purpurea, No. 218, tree seedling, S. L. Wood; Tapantí, Cartago, 2-V1I-63, 1300 m , No. 10, Conostegia oerstediana, No. 106, woody vine, S. L. Wood.

Biology.- Specimens were taken from stems $2-4 \mathrm{~cm}$ in diameter. The "parasitic" habit described above for the genus applies to this species.

Notes.- The above treatment was based on the holotype and on 82 other specimens.

My Tapantí, Costa Rica (No. 1963-106), collection contained a mixture of barbatus and cincinnatus. The very subtle differences between these species was interpreted as individual variation within one species until the two patterns of "glandular" microtorichia on the female frons were seen. This character then indicated that several other less conspicuous features had taxonomic significance and that cincinnatus is a valid species, contrary to an earlier opinion (Wood 1973:175).

## Genus CORTHYLUS Erichson

Corthylus Erichson, 1836, Archiv Naturgesch. 2(1):64 (Type-species: Bostrichus compressicornis Fabricius, subsequent designation through monotypy by Ferrari, 1867)
Morizus Ferrari, 1867, Die Forst- und Baumzuchtschädlichen Borkenkäfer, p. 69 (Typespecies: Morizus excisus Ferrari, monobasic); Eichhoff, 1870, Berliner Ent. Zeitschr. 13:300. Synonymy
Pseudocorthylus Ferrari, 1867, Die Forst- und Baumzuchtschädlichen Borkenkäfer, p. 59 (Type species: Pseudocorthylus letzneri Ferrari, subsequent designation by Hopkins, 1914. Proc. U.S. Nat. Mus. 48:128); Wood, 1977, Great Basin Nat. 37:511. Synonymy
Diagnosis.- This difficult genus is distinguished from other members of the tribe by the 1 -segmented antennal funicle, by the distinctive, asymmetrical antennal club, by the entire elytra, by the simple, transverse, prothoracic precoxal piece, by the subquadrate (or triangular) antennal scape, and by the distinctive combination of characters on the protibia and elytral declivity.

Description.- Length $1.2-4.3 \mathrm{~mm}$, 2.0-2.5 times as long as wide; color yellowish brown to black, several species bicolored.

Frons sexually dimorphic, males convex and subglabrous, females flat to strongly concave and subglabrous to elaborately
ornamented by setae. Eye emarginae; finely to very coarsely faceted. Antennal club sexually dimorphic, males moderately large, slightly asymmetrical, and without specialized tufts of hair, female club moderately to very large, strongly to very strongly asymmetrical, lateral margin of posterior face usually ornamented by a pennicellate tuft of hair; one to three sutures usually present, l often partly or entirely septate. Pronotum as long or longer than wide, lateral margins usually marked by a fine raised line (several exceptions); anterior margin usually with several serrations in female, male usually with one pair of median serrations. Scutellum large, flat. Elytral dise finely sculptured, punctures almost always confused; declivity convex, sulcate, or truncate, small denticles present in a few species. Vestiture usually confined to head and elytral declivity. Female protibia with posterior face flat and smooth or inflated and variously tuberculate.

Distribution.- SE Canada to Argentina; about 90 species are known, 56 of them occurring in North and Central America.

Bıology.- Recently cut or broken limbs are usually selected for attack, although columbianus Hopkins may breed in the bole of living trees without killing them. The male forms the entrance tunnel and at least part of one or both egg galleries. The female then joins him and completes the two transverse egg galleries that extend in opposite directions along growth rings about $5-10 \mathrm{~mm}$ below the wood surface. In many species these tunnels may meet on the opposite side of the branch, thus forming a continuous circular ring. In smaller stems the egg galleries follow opposite spiral courses upward and downward from the inner end of the entrance tunnel. Both types of galleries may occur in the same species. In all tropical species observed by me the female formed the complete larval cradle. The cradle was then inoculated with the ambrosial fungus on which an egg was deposited near the open end. The mycelial growth then sealed the opening, apparently with the aid of mycelial material or frass placed at the opening by the parent beetle. After hatching, the larva assumed a U-shape and fed largely near the cradle opening and passed excrement into the parental gallery. The larva apparently was free to feed
throughout the larval cradle. Pupae always formed with the head at the open end of the
cradle. Emergence was through the parental entrance hole.

## Key to the Species of Corthylus

1. Posterolateral margin of elytral declivity broadly rounded, occasionally feebly elevated near costal margin; if elevated, then crest of this carina more weakly raised than costal margin and with median side of crest flat or convex; a weak declivital sulcus, if present, not extending laterally beyond interstriae 32

- Posterolateral margin of declivity moderately to rather strongly elevated, crest
higher than elevation on costal margin, its mesal slope concavely impressed;
declivity more broadly impressed, often dentate; cirrus on female antennal
club commonly very long (absent in a few species); anterior tibiae with
posterior face usually inflated and/or dentate (except uniceptis, trucis, luridus) ..... 31
2(1). Posterolateral margin of elytral declivity broadly rounded, without any indication of an abrupt elevation; mostly smaller species ..... 3
- Posterolateral margin of elytral declivity with an abrupt, weakly elevated ridge extending dorsad from costal margin a short distance; mostly larger species19
3(2). Antennal club entirely aseptate or with a short, partial septum on mesal or lateral third of suture 1 , suture 2 rarely indicated by a groove, never septate ..... 4
- Antennal club with sutures 1 and 2 indicated by parallel grooves, 1 septate throughout, 2 sometimes septate (except 2 neither grooved nor septate in comosus) ..... 13
4(3). Antennal club completely aseptate (males of setusus sometimes very finely septate) ..... 5
- Antennal club with a partial septum on mesal end (or in some males also lateral third) of suture 1 ..... 9

5(4). Fine raised line on basal margin of pronotum continued to lateral and anterior margins without interruption; anterior slope and anterior margin on female pronotum unarmed; elytral declivity simple, without elevations, impressions, or conspicuous punctures; Costa Rica and Venezuela; Cecropia leaf petioles; $2.0-2.5 \mathrm{~mm}$ 1. cecropii Wood

- Raised basal line not reaching anterior margin of pronotum; anterior slope and anterior margin of female pronotum armed by asperities; elytral declivity with interstriae 1 strongly convex, 2 impressed, punctures and granules conspicuous6
6(5). Declivital interstriae 2 as wide as 3 and bearing a row of punctures or tubercles ..... 7
- Declivital interstriae 2 impressed, narrow, without punctures or granules ..... 8

7(6). Declivital interstriae 2 not impressed, with a row of minutely granulate setiferous punctures; strial punctures on declivity small; interstriae punctured; Costa Rica; 2.0 mm 2. granulifer Wood

Declivital interstriae 2 impressed, 2 and lateral interstriae each bearing a row of small tubercles; strial punctures on declivity distinctly larger; declivity steeper; Costa Rica; 2.2-2.4 mm
3. retusus Wood

8(6). Declivital interstriae 2 very narrow, essentially obsolete; female frons with excavated area 1.8 times as long as wide, punctures in excavated area much smaller, spaced by more than twice diameter of a puncture, vestiture in excavated area minute, sparse; Costa Rica; 1.7-2.0 mm
4. retusifer Wood

- Declivital interstriae 2 moderately narrow, less deeply impressed; female frons with excavated area 1.5 times as long as wide, punctures in concave area coarse, deep, close, spaced by diameter of a puncture; Puebla to Costa Rica; $1.7-2.2 \mathrm{~mm}$

5. villus Bright

9(4). Female frons rather shallowly concave from epistoma to upper level of eyes; antennal club moderately asymmetrical, without external grooves; declivity with abundant pubescence; very small species

- Female frons strongly, broadly concave to well above eyes; antennal club strongly asymmetrical, with conspicuous grooves in positions of sutures 1 and 2; larger species
10(9). Entire declivital area finely, densely punctured, and covered by abundant, short, hairlike setae, interstriae 1 not elevated; female frons coarsely, deeply punctured; elytral dise shining, not reticulate; Costa Rica to Panama; 1.4-1.7 mm

6. villifer Wood

- Declivital area less densely, less deeply punctured, interstriae 1 strongly elevated; female frons finely, sparsely punctured; eyes very coarsely faceted; elytral dise dull, strongly reticulate; declivital interstriae 3 with a row of bristles; Costa Rica; 1.0-1.2 mm

7. oculatus Wood

11(9). Declivity evenly convex, strial punctures obsolete, interstriae indicated by sparse rows of minute granules on 1-3; color uniformly brown; Costa Rica; 2.4 mm
8. bifurcus Schedl

- Declivital interstriae 2 distinctly impressed and entirely devoid of granules, punctures on striae 1 and 2 reduced but visible, bicolored

12
12(11). Strial punctures on posterior half of dise and declivity small, distinct, in rows; interstriae on declivity with rows of granules; female frontal excavation more coarsely punctured; Costa Rica; Bamboo; 2.5-2.9 mm 9. calamarius Wood

- Strial punctures on disc and declivity obsolete, decivital granules not evident or exceedingly minute; female frons more finely punctured; Costa Rica; Bamboo; 2.5-2.8 mm

10. cannularius Wood

13(3). Elytral declivity with interstriae 1-3 unarmed, 3 occasionally with minute
granules, 2 moderately impressed .......................................................................... 14

- Declivital interstriae $1-3$ each armed by a row of granules, 2 only slightly impressed; female frons with a large median callus at vertex

18
14(13). Punctures on elytral disc only slightly larger than those on pronotal disc; elytra
brown: smaller speci................................................................................................

- Punctures on elytral disc several times larger than those on pronotal disc; elytra black; larger species
15(14). Antennal club with suture 2 obsolete; female frons more extensively excavated, at least a third of its area above eyes; posterior third of elytra densely pubescent; Costa Rica; Piper; $2.5-2.8 \mathrm{~mm}$

11. comosus Wood

- Antennal club with sutures 1 and 2 clearly marked; female frons less extensively excavated, extending only slightly above eyes; posterior third of elytra very sparsely pubescent; Guatemala to Panama; 1.8-2.1 mm

12. collaris Blandford

16(14). Pronotum black; strial punctures on declivity minute, interstriae at least six times as wide as striae; fernale frons more shallowly concave, a feeble median carina near and on epistoma, a median callus near vertex; Costa Rica; 2.7-3.0 mm

- $\quad$| Pronotum reddish brown, strial punctures on declivity larger, interstriae about |
| :--- |
| three times as wide as striae; female frons more deeply concave, without any |
| indication of a carina near epistoma or on vertex ...................................................... 17 |

17(16). Declivital sulcus less deeply impressed, punctures slightly smaller; female frons with punctures much less abundant, interspaces irregular but averaging more than twice diameter of a puncture, vestiture very fine, less abundant, shorter; apex of female antennal club more broadly rounded, minutely sinuate, cirrus short, ending remote from apex of club; Costa Rica to Panama; 2.5-3.0 mm
14. rubricollis Blandford

- Declivital sulcus more deeply impressed, punctures larger; female frons more densely punctured, interspaces averaging less than diameter of a puncture, vestiture coarser, longer, much more abundant; apex of female club more narrowly rounded, with about three to five serrations, cirrus attaining apex of club; Costa Rica; 2.8-3.0 mm

15. sanguineus Schedl

18(13). Elytra stouter, 1.1 times as long as wide; strial punctures on declivity very fine,
interstrial tubercles smaller; Costa Rica to Panama; $2.8-3.0 \mathrm{~mm} . . . . . . . . . . . . . . . . . . . . . . ~$
16. panamensis Blandford

- Elytra more slender, 1.3 times as long as wide; strial punctures on declivity larger, interstrial tubercles larger; Puebla to Guatemala; $2.5-2.8 \mathrm{~mm}$

17. consimilis Wood

19(2). Elytral declivity convex, strial and interstrial punctures confused or at least
with interstriae 2 punctured, interstriae 3 rarely granulate; larger than 3 mm ........ 20

- Declivital interstriae 2 impressed and impunctate, punctures of striae 1 and 2
in rows, interstriae 3 sometimes granulate (doubtful species smaller than 3 mm ) ... 25

20(19). Female antennal club moderately asymmetrical, sutures 1 and 2 almost
straight, I and sometimes 2 finely septate; unicolorous; in various hosts ................. 21
Female antennal club strongly asymmetrical, suture 1 moderately, 2 rather
strongly procurved, both aseptate; bicolored brown and dark brown; in
bamboo ....................................................................................................................... 24
21(20). Elytral punctures on dise and declivity very small, only slightly larger than those on pronotal disc; Michoacán and Distrito Federal to Chiapas; 4.0-4.3 mm 18. nudus Schedl

- Elytral punctures rather coarse, much larger than on pronotal disc; smaller
species
22

22(21). Body stouter, 2.06 times as long as wide; female frons with margin of concave area narrowly separated from inner margin of eye, its lateral margin devoid of a tuberculate callus just above level of antennal insertion; Costa Rica; 3.1 mm 19. granulatus Schedl

- Body more slender, at least 2.2 times as long as wide; female frons with lateral margin of concavity at inner margin of eye, with a conspicuous tuberculate callus at margin slightly above level of antennal insertion
23(22). Elytral declivity less strongly convex; declivital punctures smaller, not as deep, interstriae 2 at least six times as wide as a puncture; Distrito Federal and Mexico (state) to El Salvador; 3.3-3.6 mm
Elytral declivity more strongly convex; declivital punctures much larger, deeper, interstriae 2 about three times as wide as a puncture; Colorado and Ontario to Arkansas and North Carolina; $3.0-3.3 \mathrm{~mm}$

| ). | Anterior margin of pronotum coarsely serrate, median pair larger in male; setae on interstriae 8 and 9 sparse and shorter on basal half of elytra; Costa Rica; Bamboo; 3.0-3.3 mm <br> 22. brunnescens Wood |
| :---: | :---: |

25(19). Female antenna with cirrus extending to or very slightly beyond apex of club;
declivital sulcus very weakly impressed; Puebla to Panama; 2.3-3.4 mm ...........
24. comatus Blandford

- $\quad \begin{aligned} & \text { Female antenna either without cirrus or cirrus poorly developed, ending well } \\ & \text { before apex of club; declivital sulcus more strongly impressed ................................ } 26\end{aligned}$

26(25). Declivital interstriae 1 entirely devoid of granules; female antenna with a
small, distinct cirrus on posterior face of club; smaller species ................................ 27

- Declivital interstriae 1 with a row of fine granules; female antennal club without a cirrus; larger species
27(26). Declivital interstriae 1 more strongly convex, as high as lateral convexities; female frons narrower, distance from upper level of eyes to epistoma equal to distance between eyes, lateral margin from eye to level of antennal insertion subacutely elevated, surface of concavity much more coarsely, more sparsely punctured, vestiture in concave area less abundant, very fine; Costa Rica to Panama; 2.7-3.1 mm

25. strigilis Wood

- Lateral convexities of declivity much higher than sutural interstriae; female frons wider, distance from upper margin of eye to epistoma distinctly less than distance between eyes, lateral margins rounded, concave area densely, finely punctured, vestiture much more abundant
28(27). Declivital sulcus more strongly impressed, wider, including entire width of interstriae 2; sutures of antennal club straight in male, feebly, equally arcuate in female; Guatemala; $2.5-2.6 \mathrm{~mm}$

26. diligens Wood

- Declivital sulcus shallow, narrow, ascending laterally from striae 1 ; sutures of antennal club weakly arcuate in male, in female 1 weakly, 2 much more strongly arcuate; Costa Rica; $3.4-3.5 \mathrm{~mm}$

27. zelus Wood
$29(26)$. Body stout, 2.0 times as long as wide; declivital striae 1 and 2 with punctures larger, deeper, interstriae 2 more strongly impressed; female frons with a median subcarinate, impunctate callus from epistoma to vertex; female antennal club with apical margin straight, median apical angle more abruptly rounded; Panama; 3.9-4.2 mm
28. ptyocerus Blandford

- Body more slender, at least 2.2 times as long as wide; declivital punctures on striae 1 and 2 smaller, not as deep, interstriae 2 less strongly impressed; female frons without a median elevation; apical margin of female antennal club arcuate
30(29). Elytral declivity more strongly convex, strial punctures larger, deeper; declivital interstriae 2 less strongly impressed, much narrower than 1 or 3; punctures on pronotal disc larger, distinct; apical margin of female antennal club entire, almost smooth; Kansas and Massachusetts to Tennessee and Georgia; 3.6-3.8 mm

29. columbianus Hopkins

- Elytral declivity more broadly convex, strial punctures very small, shallow; declivital interstriae 2 more strongly impressed, as wide as 1 or 3 ; punctures on pronotal disc minute to obsolete; apical margin of female antennal club subserrate, its posterior side armed by several small tubercles; Puebla to Oaxaca; $3.4-3.9 \mathrm{~mm}$

| 31(1). | Small species less than 1.8 mm in length; posterior face of anterior tibia mod- <br> erately inflated and armed by a few minute, confused tubercles; declivital <br> structure rather simple except truncate in trunculus; suture 1 on antennal club |
| :--- | :--- |
| septate (if doubtful, trunculus, female frons convex) .................................................. 32 |  |

32(31). Elytral declivity abruptly truncate, a small tooth on its basal margin in position
of interstriae 3; sutures on female antennal club very strongly procurved; fe-
male frons broadly convex, ornamented by abundant, uniformly distributed,
fine, long hair; Costa Rica to Panama; 1.3-1.4 mm .................. 31. trunculus Wood

- Elytral declivity convex, its margin rounded on upper three-fourths; sutures on female antennal club weakly procurved; female frons concave

33
33(32). Body more slender, 2.4 times as long as wide; elytral declivity very steep, broadly concave, interstriae 1 very strongly elevated; Veracruz; 1.4 mm $\qquad$

- Body stouter, 2.2-2.3 times as long as wide (except 2.5 in nanus); declivity
more gradual, more strongly convex, interstriae 1 less strongly elevated, wider
than high
34

34(33). Declivity bisulcate, interstriae 1 narrowly, abruptly elevated, 2 conspicuously impressed, 3 broadly rounded, as high as 1 ; female frons narrower than width of an eye, very shallowly impressed below upper level of eyes; Honduras; $1.3-1.4 \mathrm{~mm}$
33. minimus Wood

- Declivity evenly convex, interstriae 1 weakly elevated, 2 not impressed; female frons at least twice as wide as width of an eye, strongly concave from epistoma to vertex
35(34). Declivity with interstriae 2 entirely unarmed; female frons with margins rounded, concavity with abundant, moderately long hair; Panama; $1.5-1.8 \mathrm{~mm}$ (see also 35. nevermanni Schedl and 36. nanus Wood) 34. pumilus Wood
- Declivital interstriae 2 armed by a row of minute granules similar to those on 1 and 3 ; female frons with lateral margin below eye subacute, concavity with sparse, minute hair; Oaxaca to Honduras; $1.2-1.4 \mathrm{~mm}$

37. minutissimus Schedl

36(31). Posterior face of protibia flat, unarmed; female antennal club with three strongly procurved sutures, anterior face entirely pubescent; posterolateral margin of declivity finely, acutely elevated on lower fourth, margins rounded above, declivity broadly convex, interstriae 1-3 equally, rather finely, not closely granulate ( 2 unarmed in uniseptis; only one tubercle in luridus); female frons broadly concave from epistoma to vertex, concave area densely, finely punctured, finely pubescent, hair of uniform length except median line impunctate and glabrous

- Posterior face of protibia inflated and/or tuberculate; declivital interstriae 2 never with a row of tubercles
37(36). Smaller; declivital interstriae 2 unarmed, 1 and 3 each with about two widely spaced granules; Veracruz to Chiapas; $1.8-2.1 \mathrm{~mm}$ $\qquad$ 39. parvulus Blandford and 38. uniseptis Schedl
- Larger; elytral declivity armed by very sparse granules on interstriae 2; declivital interstriae 1 and 3 each armed by six or more granules38

38(37). Declivital tubercles rather fine; transverse spongy area on posterior face of female antennal club occupying middle third of club length almost from mesal to lateral margin; Costa Rica; 2.9-3.1 mm

- Declivital tubercles rather coarse; transverse spongy area on female antennal club a slender band occupying only a small part of a much larger impressed area; Guatemala to Panama; 2.3 mm 41. luridus Blandford
39(36). Elytral declivity essentially convex, posterolateral margin restricted to lower fourth of declivity or less, rather weakly elevated ..... 40
- Elytral declivity truncate, posterolateral margin subacutely elevated on more than lower half of declivity, if doubtful then interstriae 1 very strongly elevated ..... 49
40(39). Elytral declivity with interstriae 1 armed by a series of granules ..... 41
- Declivital interstriae 1 entirely unarmed by granules ..... 4441(40). Declivity more strongly, evenly convex, interstriae 1-3 each armed by a row ofvery small granules, 2 equal in height, width, and convexity to 3 ; yellowishspongy area on female frons large, in lateral areas almost attaining upper levelof eyes, attaining level of lower inner margin of eye at median line; Durangoto Guerrero; $2.5-2.7 \mathrm{~mm}$42. detrimentosus Schedl- Declivity variously impressed, not evenly convex, interstriae 2 unarmed, weak-ly impressed (occasional specimens of nolenae with a few granules at base);yellowish spongy area on female frons smaller, not extending above lowerinner margin of eye (female of spinosus unknown)42
42(41). Elytral declivity with posterolateral margin subacutely elevated from sutural apex to slightly above middle of declivity, declivital face rather weakly con- vex; longitudinally oval, yellowish, spongy area on female frons occupying me- dian third, upper margin of concave area ornamented by a brush of long hair; Puebla to Honduras; $2.3-2.5 \mathrm{~mm}$ 43. mexicanus Schedl
- Posterolateral margin of declivity subacutely elevated on less than lower fourth; yellowish, spongy area on female frons wider (spinosus unknown) ..... 43
43(42). Declivital interstriae 2 feebly or not at all impressed, granules on 1 and 3 verysmall, strial punctures coarse, deep; male frons coarsely, sparsely punctured,smooth on lower half; female frons with median carina on upper two-thirds ofconcave area, spongy area reniform; elytra black, pronotum reddish brown;Oaxaca; Nolena; $2.0-2.3 \mathrm{~mm}$
- Declivital interstriae 2 distinctly impressed, tubercles on 1 and 3 rather coarse, sharply pointed, strial punctures small, shallow; male frons more finely punctured, reticulate from epistoma to vertex; Veracruz; 2.0 mm

44(40). Declivital interstriae 2 largely obsolete, 3 with a series of about two to five rather coarse, pointed denticles; declivital sulcus rather deep; female frons with a pair of large, spongy areas on lower area, upper margin bearing a brush of long hair, concave area almost glabrous45

- Declivital interstriae 2 of normal width, 3 with minute granules or unarmed, 1 and 3 rather weakly elevated; female frons without yellowish, spongy area, concave area with abundant pubescence ..... 4645(44). Smaller; spongy areas on each half of female frons subcircular, extendingslightly more than half distance from epistoma to upper level of eyes, marginsof spongy areas marked by a row of fine, long hair; Chiapas; 1.6 mm

46(44). $\begin{aligned} & \text { Smaller; declivital impression on interstriae } 2 \text { rather weak, less extensive, } 1 \text { as } \\ & \text { high as 3, lower area subconcave only near costal margin; female frons slightly } \\ & \text { less strongly concave ................................................................................................ } 47\end{aligned}$

- Larger; declivital impression deeper, much more extensive, interstriae 3 conspicuously higher than 1 , lower fifth of declivity subconcave; female frons more strongly concave

$$
48
$$

47(46). Punctures on elytral disc slightly smaller, surface partly or entirely reticulate; female frons very shallowly concave; Costa Rica; 1.5-1.8 mm .
48. pygmaeus Wood

- Punctures on elytral disc slightly larger, surface shining; female frons more strongly concave, particularly on lower half; Florida and Nayarit to Brazil; $2.0-2.4 \mathrm{~mm}$

49. spinifer Schwarz

48(46). Female frons above eyes almost flat, setae at upper margin of concave area longer, equal to half distance from their bases to epistomal margin; male frons more finely, sparsely punctured; Nayarit and Veracruz to Guatemala; 2.5-3.0

$$
\mathrm{mm}
$$

50. flagellifer Blandford

- Female frons above eyes conspicuously concave, setae at upper margin shorter, equal to less than one-third distance from their bases to epistomal margin; male frons rather coarsely, closely punctured; Costa Rica; 3.0-3.4 mm .

## 51. sobrinus Wood

49(39). Posterolateral margin of declivity subacutely elevated on lower one-half to three-fourths, interstriae 1 strongly elevated, its summit strongly serrate, interstriae 3 with several small granules

$$
.50
$$

Posterolateral margin forming a complete circumdeclivital ring, interstriae 1 uniformly elevated, its surface not serrate
50(49). Posterolateral margin of declivity subacutely elevated on lower half of declivi-، ty; declivital surface reticulate; female frons with a large, yellowish, spongy area occupying lower third of concave area; Costa Rica; 2.3-2.5 mm
52. subserratus Wood

- Posterolateral margin of declivity subacutely elevated on lower three-fourths of declivity; declivital surface smooth; female frons with central half on upper two-thirds abruptly, much more strongly impressed; Costa Rica to Panama; $2.0-2.3 \mathrm{~mm}$

53. serratus Wood

51(49). Body slender, 2.4 times as long as wide; female frons with large, yellow, spongy area on lower fourth; subacute margin of declivity discontinued at base, not crossing interstriae 1 ; female antennal club with cirrus absent or much shorter than length of club

$$
52
$$

- Body stouter, 2.0-2.2 times as long as wide; female frons without spongy area (except eichhoffi); subacute margin of declivity continued to suture at base; female antennal club with cirrus much longer than club (about as long as club in procerus)

$$
.53
$$

52(51). Declivity flat to feebly convex, reticulate, punctures rather small, interstriae 1 finely serrate throughout its length; female antennal club with a cirrus about half as long as club; Guatemala; 1.8 mm .54. praeustus Schedl

- Declivity slightly concave, brightly shining, rather coarsely punctured, interstriae 1 a continuous costa throughout its length; female antennal club without a cirrus; Arizona to Durango; Quercus; 2.0-2.1 mm

53(51). Declivital surface slightly convex, interstriae 3 armed by about two to four small, pointed tubercles; female frons almost flat, large central area smooth, impunctate, punctured only on lateral pubescent areas; Chiapas to Panama; $2.0-2.3 \mathrm{~mm}$
56. concisus Wood

- Declivital surface flat, interstriae 3 unarmed; female frons broadly, rather

54(53). Female epistoma normal, brush of hair on vertex yellow, slightly shorter, ending slightly above upper level of eye (sparse hair continues to epistomal area); apex of female antennal club rounded; declivital interstriae 1 rather strongly elevated; Oaxaca to Panama; $1.7-1.9 \mathrm{~mm}$
57. procerus Bright

- Female epistoma broadly, very strongly elevated, apical half of its dorsal surface yellow and spongy, brush of hair on vertex reddish, slightly longer, dense area extending slightly below upper level of eye; apex of female club acutely pointed; declivital interstriae 1 rather weakly elevated; Costa Rica; 2.3 mm .....

58. eichhoffi Schedl

## 1. Corthylus cecropii Wood

Corthylus cecropii Wood, 1975, Great Basin Nat. 35:31
(Holotype, female; Tapantí, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This aberrant species is distinguished from all other species in the genus by the small, aseptate antennal club, by the absence of female pronotal asperities, and by the minute to obsolete punctures of the pronotum and elytra.

Female.- Length $2.0-2.5 \mathrm{~mm}, 2.3$ times as long as wide; color black.

Frons uniformly, deeply concave from eye to eye, from epistoma to vertex; surface densely, uniformly, very finely punctured over entire surface; vestiture very fine, rather abundant, uniformly rather short over concave area, margin above eyes with a dense row of very long hair, a small tuft of longer hair at level of antennal insertion on lateral half. Antennal club 1.6 times as long as wide; asymmetrically obovate, aspetate, entire surface minutely pubescent; posterior face with a small tuft of hair extending about half of club length beyond apex.

Pronotum 1.1 times as long as wide; sides weakly arcuate on posterior half, broadly rounded in front, a distinct, submarginal, transverse constriction; anterior margin unarmed; summit indefinite, near middle; asperities absent; surface reticulate, anterior half with sparse, minute granules, posterior half with sparse, minute punctures. Acute lateral margins more strongly developed than in other species. Glabrous.

Elytra 1.3 times as long as wide, 1.2 times as long as pronotum; sides almost straight and parallel on basal two-thirds, obtusely subangulate behind; disc reticulate, a few obscure, irregular lines indicated, punctures minute, mostly obsolete, apparently confused. Declivity occupying slightly more than posterior third, rather steep, convex; sculpture as on disc, except a few irregularly placed fine granules usually present. Vestiture confined to declivity, consisting of sparse, short, fine bristles apparently on oddnumbered interstriae.

Male.- Similar to female except frons convex, a distinct, transverse impression above epistoma, surface smooth, shining, impunctate; anterior margin of pronotum distinctly produced toward median line and armed by two slender teeth; anterior slope of pronotum much steeper, asperate.

Distribution.- Costa Rica and Venezuela.

COSTA RICA: San Vito, Puntarenas, 13-III-68, H. Hespenheide; Tapantí, Cartago, 5-V, 24-X-63, and 9-III$64,1300 \mathrm{~m}$, nos. 19, 243, 467, Cecropia leaf petioles, S. L. Wood. OTHER COUNTRIES: Venezuela.

Host.-Cecropia peltata.
Biology. - Recently fallen leaf petioles are selected for attack. The spiral-shaped tunnels are formed where the pith meets the harder outer tissues on the basal half of the petiole. Usually fewer than three larvae develop in each system. In a majority of the gallery systems examined one or more branches contained a pair of Tricolus cecropii Wood (Costa Rica) or T. intrusus Wood (Venezuela). It
appeared as though the Tricolus species had entered the newly formed tunnel of this species and assumed ownership. In most instances the Corthylus was either missing or else dead in a remote part of the tunnel; in a few instances the Corthylus formed a new branch tunnel beginning near the entrance hole and continued normal activities.

Notes.- The above treatment was based on the type series of 26 specimens and on 4 other specimens.

## 2. Corthylus granulifer Wood

Corthylus granulifer Wood, 1974, Great Basin Nat. 34:18I (Holotype, male; 15 km SE Cartago, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from retusus Wood by the smaller size, by much smaller tubercles on the elytral declivity, by the uniformly convex declivity laterad from striae 1 , and by the more slender body form.

Male.-Length $2.0 \mathrm{~mm}, 2.5$ times as long as wide; color dark brown.

Frons broadly convex, ascending slightly toward epistomal margin; surface shining at epistoma, reticulate above, reticulate area with sparse, rather fine punctures; vestiture sparse, inconspicuous. Antennal club as in retusus.

Pronotum 1.0 times as long as wide; anterior margin with median pair of serrations much larger, otherwise as in retusus female.

Elytra 1.5 times as long as wide, 1.5 times as long as pronotum; similar to retusus except elytral surface smoother, strial punctures near declivity almost in rows, declivital interstriae 2 not impressed, 3 not elevated, tubercles much smaller, declivital vestiture apparently longer and slightly more abundant.

Distribution.- Costa Rica.
COSTA RICA: 15 km SE Cartago, Cartago, 24-IX-63, 1800 m, No. 200, Myrica pubescens, S. L. Wood; Volcán Poás, Heredia, 9-XI-63, 2500 m , No. 261 , tree branch, S. L. Wood.

Notes. - The above treatment was based on the type series of two male specimens.

## 3. Corthylus retusus Wood

Fig. 221
Corthylus retusus Wood, 1974, Great Basin Nat. 34:I81 (Holotype, female; Tapantí, Cartago, Costa Rica; Wood Coll.)

Diagnosis.- This species is distinguished from granulifer Wood by characters summarized in the diagnosis of that species.

Female.- Length $2.2-2.4 \mathrm{~mm}, 2.3$ times as long as wide; color very dark brown.

Frons deeply concave from eye to eye, from epistoma to vertex, lateral margin carinate from eye to lateral part of vertex; surface of lower half reticulate, upper half shining, slightly irregular, minutely, rather closely punctured, glabrous; a pair of widely spaced slender, hornlike denticles near upper margin of concave area. Antennal club asymmetrically subquadrate, 1.4 times as long as wide; anterior surface minutely pubescent; suture 1 obscurely indicated by an obscure septum, 2 marked by an obscure groove; posterior face with a small tuft of hair extending slightly beyond apex of club.

Pronotum 0.93 times as long as wide; sides almost straight and parallel on basal half, abruptly converging to rather broadly rounded anterior margin; anterior margin with about 10 low serrations (viewed from cephalic aspect); summit indefinite, slightly anterior to middle; anterior slope coarsely asperate; posterior areas subshining, weakly reticulate, punctures minute, moderately abundant. Glabrous.

Elytra 1.3 times as long as wide, 1.5 times as long as pronotum; sides very feebly arcuate and subparallel on basal two-thirds, rather broadly rounded behind; disc smooth, shining, with obscure, irregular lines indicated, punctures small, confused, moderately abundant. Declivity convex, steep; interstriae 1 uniformly, abruptly elevated from near base to near apex, about as high as wide on middle half, its summit smooth, shining, with sparse punctures; interstriae 2 moderately, broadly impressed, 3 convex, slightly elevated, $2-5$ each bearing a row of conspicuous, closely spaced, pointed tubercles. Vestiture confined to declivity, of fine, long, interstrial hair.

Protibia with posterior face subrugose, unarmed.

Male.- Similar to female except frons and anterior margin of pronotum as in male granulifer; antennal club smaller, less strongly asymmetrical, tuft of hair absent.

## Distribution.- Costa Rica.

COSTA RICA: 15 km SE Cartago, Cartago, 24-IX-63, 1800 m , Nos. 198 from Solanum torvum, 195 from tree seedling, S. L. Wood; Tapantí, Cartago, 2-VII-63, I300 m, No. 9, Miconia, 26-XI-63, No. 265, Phoebe mexicana, S. L. Wood.

Hosts.- Miconia sp., Phoebe mexicana.
Biology.- Specimens were taken from branches $3-4 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 113 specimens.

Fig. 221. Corthylus spp., female outlines from dorsal and lateral aspects: A, B, retusifer; C, D, E, retusus; F, G, villus; H, I, calamarius.

## 4. Corthylus retusifer Wood Fig. 221

Corthylus retusifer Wood, 1974, Great Basin Nat. 34:183 (Holotype, female; Tapanti, Cartago, Costa Rica: Wood Coll.)
Diagnosis.- This species is distinguished from retusus Wood by the characters of the antennal club and elytral declivity cited below.

Female.- Length $1.7-2.0 \mathrm{~mm}, 2.3$ times as long as wide; very dark brown (holotype not fully darkened.)

Frons as in retusus; antennal club more nearly subcircular, sutures 1 and 2 entirely obsolete except for a very small piece of septum of 1 on lateral margin. Pronotum and elytra as in retusus except declivital interstriae 2 impressed, very strongly narrowed, almost obsolete, unarmed, 3 weakly convex, $3-5$ armed by small granules about as in granulifer Wood.

Male.- Similar to female except frons, antenna, and anterior margin of pronotum as in male granulifer.

Distribution.- Costa Rica.
COSTA RICA: Tapantí, Cartago, $1300 \mathrm{~m}, 2$-VII-63, No. 7, woody vine, 17-IX-63, No. 176, tree branch. 26-XI-63, No. 265 in Phoebe mexicana, No. 266 in tree branch, S. L. Wood.

Biology.- Specimens were taken from stems $3-5 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of nine specimens.

## 5. Corthylus villus Bright <br> Fig. 221

Corthylus villus Bright, 1972, Canadian Ent. 104:1371 (Holotype, female: Yerba Buena 32 km or 20 miles N Bochil, Chiapas, Mexico; Canadian Nat. Coll., 12640)
Diagnosis.- This species is distinguished from retusifer Wood by characters of the frons and elytral declivity as indicated below.

Female.- Length $1.7-2.2 \mathrm{~mm}, 2.3$ times as long as wide; color dark brown.

Frons as in retusifer except surface of concave area very closely, deeply, coarsely punctured, with moderately short, rather abundant, fine hair of uniform length. Pronotum and elytra as in retusifer except declivital interstriae 2 more strongly, more broadly impressed, its surface smooth, shining, with impressed points, granules on interstriae 3-5 slightly smaller.

Male.- Similar to female except antennal club smaller; frons and anterior margin of pronotum as in male granulifer Wood.

Distribution.- Puebla to Costa Rica.
MEXICO: Chiapas: Yerba Buena, 32 km or 20 mi N Bochil, 2l-V-69, 2300 m , D. E. Bright. Puebla: 9 km NE Teziutlán, 27-VI-53 and 2-VII-67, 1500 m , Aluus, S. L. Wood. GUATEMALA: Guatemala City, $30-\mathrm{V}-64,1300$ m, No. 648, tree branch, S. L. Wood; Volcán Pacaya, Esquintla, l-V1-64, 1300 m, No.651, Celtis iguanae, S. L. Wood; Volcán Zunil, Quezaltenango, 27-V-64, 1000 m , No. 627, tree seedling, S. L. Wood. COSTA RICA: San José, San José, 12-IX-63, 1300 m , No. 163, Spondias purpurea, S. L. Wood; Tapantí, Cartago, 17-V1II-63, 1300 m , No. 107, tree branch, S. L. Wood; Río Damitas in Dota Mts.. San José, 18-II-64, 250 m , flight, S. L. Wood; Santa Ana, San José, l-VIII-63, 1300 m, No. 96, shrub, S. L. Wood; Turrialba, Cartago, 1970, R. I. Gara.

Biology.- Specimens were taken from branches $3-5 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on 2 paratypes and on 106 other specimens.

## 6. Corthylus villifer Wood

Corthylus cillifer Wood, 1974, Great Basin Nat. 34:183
(Holotype, female; 15 km SE Cartago, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This unique species is distinguished from all others in the genus by the small, slender form, by the abundant, minute setae on the posterior half of the elytra, by the female antennal club and frons, and by other characters.

Female.- Length $1.4-1.7 \mathrm{~mm}, 2.5$ times as long as wide; color brown.

Frons rather shallowly concave from eye to eye from epistoma to upper level of eyes, a median, shining callus on epistoma; surface shining, punctures coarse, close, deep; vestiture of fine, long, uniformly distributed hair. Antennal scape rather strongly flattened; club large, asymmetrical, 1.3 times as long as wide, sutures obsolete except 1 at mesal margin, uniformly, finely pubescent.

Pronotum 1.05 times as long as wide; sides almost straight and parallel on basal half, rather broadly rounded in front; anterior margin unarmed; summit indefinite, slightly in front of middle; rather finely asperate on anterior slope; posterior areas reticulate, punctures small, obscure, moderately abundant; lateral margins rounded, not marked by a raised line. Subglabrous.

Elytra 1.6 times as long as wide, 1.6 times as long as pronotum; sides straight and
parallel on more than basal two-thirds, broadly rounded behind; disc smooth and shining at base, becoming strongly reticulate toward declivity, punctures sparse, small, confused. Declivity steep, shallowly, subconcavely impressed on median half, lateral and basal margins broadly rounded; surface minutely, closely punctured; impressed area extending from suture to position of interstriae 3. Vestiture largely confined to posterior fourth, of dense, minute hair, a few longer setae on marginal areas.

Protibiae subinflated on posterior face, a few very minute granules indicated.

Male.- Similar to female except frons convex, reticulate, punctures sparse, obscure, subglabrous; anterior margin armed by one median pair of large, slender teeth.

Distribution.- Costa Rica to Panama.
COSTA RICA: 15 km SE Cartago, Cartago, 24-IX-63. 1800 m , Nos. 187, 199, and 248 in Siparuna nicaraguensis, No. 201 in a woody vine, S. L. Wood; Tapantí, Cartago, 2-VII-63, 1300 m , No. 177, woody vine, S. L. Wood. Panama: Cerro Punta, Chiriquí, 11-I-64, 1800 m, No. 385, woody vine, S. L. Wood.

Biology.- Specimens were found in stems $2-4 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 82 specimens.

## 7. Corthylus oculatus Wood

Corthylus oculatus Wood, 1974, Great Basin Nat. 34:184 (Holotype, female; Pandora, Limón, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from villifer Wood by the smaller size, by the very large eyes, by the narrower, less strongly impressed female frons, and by the strongly elevated declivital interstriae 1 .

Female.- Length $1.0-1.2 \mathrm{~mm}, 2.3$ times as long as wide; color brown.

Frons narrow, shallowly concave from eye to eye from epistoma to slightly below upper level of eyes; surface smooth and shining on upper half, reticulate below, punctures sparse, fine; vestiture rather sparse, moderately long. Eye very large, coarsely faceted. Antennal club similar to villifer but slightly smaller.

Pronotum and elytra about as in villifer, except elytral disc strongly reticulate to base, declivity more nearly convex, declivital interstriae 1 strongly, acutely elevated from base to near apex, punctures not evident, a few
minute granules on interstriae 3; vestiture confined to declivity, consisting of very short, moderately abundant hair, a few long, slender bristles on declivital interstriae 1,3 , and lateral areas.

Male.- Similar to female except frons convex, reticulate, punctures obscure; anterior margin of pronotum armed by a median pair of slender teeth.

Distribution.- Costa Rica.
COSTA RICA: Pandora, Limón, 23-V111-63, 50 m , No. 142 in tree branch, No. 144 in woody vine, S. L. Wood.

Biology.- Specimens were taken from stems $1-2 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 10 specimens.

## 8. Corthylus bifurcus Schedl

Corthylus bifurcus Schedl, 1935, Rev. de Ent. 5:345 (Holotype, male; Laguna Volcán Poás, Heredia, Costa Rica; Schedl Coll.)
Diagnosis.- This species is distinguished from cannularius Wood by the slightly smaller size, by the uniformly brown color, and by characters on the elytra as described below. It resembles Corthycyclon much more closely than Corthylus species.

Male.- Length 2.4 mm , 2.4 times as long as wide; color brown, elytra slightly lighter.

As in male cannularius except elytral disc less uniformly reticulate, punctures smaller but more clearly indicated; declivity evenly convex, strial punctures obsolete, interstriae 1-3 indicated by minute granules. (In cannularius interstriae 2 is weakly impressed and devoid of granules and punctures evident on striae 1 and 2.)

Distribution.- Costa Rica.
COSTA RICA: Laguna Volcán Poás, 2600 m , T. Assmann.

Host.- Probably a native bamboo.
Notes.- The above treatment was based on the holotype.

## 9. Corthylus calamarius Wood Fig. 221

Corthylus calamarius Wood, 1974, Great Basin Nat. 34:185 (Holotype, female; Volcán Poás, Heredia, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from cannularius Wood by the distinct strial punctures that are in rows, by the larger, regularly placed interstrial granules on the
declivity, and by the more coarsely punctured female frons.

Female.- Length 2.5-2.9 mm, 2.6 times as long as wide; color yellowish brown, with anterior third of pronotum and elytral declivity dark brown to black.

Frons deeply concave from eye to eye, from epistoma to vertex; surface reticulate, punctures rather close, moderately coarse; vestiture of moderately abundant, fine, rather long hair, uniformly distributed except absent on a small median area at epistoma. Antennal club subreniform, 1.2 times as long as wide; suture 1 represented by septum on lateral third, 2 and 3 represented by arcuate grooves (secondary strengthening features, not true sutures); a small tuft of hair on posterior face not reaching apex.

Pronotum 1.02 times as long as wide; widest near base, sides weakly arcuate and converging very slightly on basal half, rather narrowly rounded in front; anterior margin serrate; summit indefinite, slightly in front of middle; anterior slope moderately steep, coarsely asperate; posterior areas finely reticulate, punctures very small, rather sparse; lateral margin rounded. Glabrous.

Elytra 1.6 times as long as wide, 1.6 times as long as pronotum; sides straight and parallel on basal two-thirds, rather broadly rounded behind; disc reticulate, punctures near base minute, obscure, confused, those on posterior third distinct and in definite strial rows. Declivity convex, steep; striae 1 and 2 with punctures minute; interstriae 2 broadly, very weakly impressed, 1-4 each with a row of small, regularly spaced granules. Vestiture confined to declivity, consisting of interstrial rows of moderately long, slender bristles.

Male.- Similar to female except frons convex, reticulate, sparsely punctured, subglabrous; antennal club smaller, less irregular in shape; median pair of serrations on anterior margin of pronotum much larger than others.

Distribution.- Costa Rica.
COSTA RICA: Volcán Poás, Heredia, 19-XI-6.3, near $2000 \mathrm{~m}, \mathrm{No} .258$, native bamboo, S. L. Wood.

Biology.-Specimens were taken in the nodes of recently cut bamboo stems $5-8 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 11 specimens.

## 10. Corthylus cannularius Wood

Fig. 222
Corthylus cannularius Wood, 1974, Great Basin Nat. 34:186 (Holotype, female; Cerro de la Muerte, San José, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from calamarius Wood by the confused, obscure to obsolete punctures near the elytral declivity, by the very minute to obsolete, irregularly placed interstrial granules on the declivity, and by the more finely punctured female frons.
Female.- Length $2.5-2.8 \mathrm{~mm}, 2.5$ times as long as wide; color yellowish brown, anterior third of pronotum and elytral declivity darker.

Frons as in calamarius except surface almost smooth, punctures minute. Pronotum as in calamarius except anterior margin more coarsely serrate (somewhat variable). Elytra as in calamarius except punctures near declivity confused or obsolete, strial punctures on declivity obsolete, interstrial granules on declivity much smaller and more widely, less regularly spaced, declivital vestiture finer and less abundant.
Male.- Similar to female except frons convex, reticulate, sparsely punctured, subglabrous; antennal club smaller, less irregular in shape; anterior margin of pronotum armed by only two coarse teeth.
Distribution.- Costa Rica.
COSTA RICA: Summit of Panamerican Highway on Cerro de la Muerte, San José, 6-VIII-63, 3200 m , No. 46 , native bamboo, S. L. Wood.

Biology.- Specimens were taken from the nodes of stems $1-3 \mathrm{~cm}$ in diameter of a dwarf bamboo about $2-3 \mathrm{~mm}$ in height.

Notes.- The above treatment was based on the type series of 40 specimens.

## 11. Corthylus comosus Wood Fig. 222

Corthylus comosus Wood, 1974, Great Basin Nat. 34:186
(Holotype, female; Tapantí, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from the very closely related villosus Eggers by the smaller pale area on the lower fifth of the female frons, by the smaller punctures on the elytral disc, by the more closely punctured elytral declivity, by the much more abundant declivital vestiture, and by the larger size (villosus $2.0-2.5 \mathrm{~mm}$ ).

Female.- Length 2.5-2.8 mm, 2.1 times as long as wide; color dark brown.

Frons deeply, uniformly concave from eye to eye, from epistoma to vertex; almost half of concave area above eyes; surface reticulate, finely, closely, uniformly punctured, lower one-sixth yellow and with punctures finer and much closer; vestiture of rather abundant, uniformly distributed, short, fine
hair, slightly longer on upper margin. Antennal club large, reniform; tuft of hair on posterior face ending before apex of club.

Pronotum 0.90 times as long as wide; widest near base, sides weakly arcuate and subparallel on basal third, broadly rounded in front; anterior margin armed by about 14 low serrations; summit indefinite, anterior slope moderately steep; asperities commence

Fig. 222. Corthylus spp., female outlines from dorsal and lateral aspects (frontal setae omitted): A, B, cannularius; C, D, comosus; E, F, collaris; G, H, rubricollis.
slightly behind middle and continue to anterior margin; posterior area reticulate, punctures minute. Minute, hairlike pubescence moderately abundant, but usually abraded.

Elytra 1.2 times as long as wide, 1.4 times as long as pronotum; sides almost straight and parallel on basal half, broadly rounded behind; disc smooth, a few very obscure irregular lines evident, punctures very fine, moderately abundant, confused. Declivity occupying posterior third, steep, evenly, broadly convex; surface smooth, shining, punctures very fine, close, confused, much closer than in villosus. Vestiture sparse on disc, abundant on entire declivity, of fine, moderately long hair, more abundant than in villosus.

Male. - Similar to female except frons convex, reticulate, rather finely punctured, vestiture sparse; anterior margin of pronotum armed by two median teeth.

Distribution.- Costa Rica.
COSTA RICA: Tapantí, Cartago, 26-XI-63. 1300 m , No. 264, Piper, S. L. Wood.

Biology.- Specimens were taken from recently cut stems $5-8 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 32 specimens. This species and villosus are restricted to Piper spp.; their habits are virtually identical. Because villosus is somewhat variable in several characters, it would not be surprising to find that comosus is only a well-marked geographical race.

## 12. Corthylus collaris Blandford Fig. 222

Corthylus collaris Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):261 (Holotype, male; Cerro Zunil. Guatemala; British Mus. Nat. Hist.)
Corthylus splendens Wood, 1967, Great Basin Nat. 27:138 (Holotype, female; 16 km SE Cartago, Cartago, Costa Rica; Wood Coll.); Wood, 1974, Great Basin Nat. 34:279. Synonymy
Diagnosis.- This species is distinguished from all the preceding members of this genus by the presence of sutures 1 and 2 on the antennal club, 2 finely septate, by the presence of a fine, raised line on the lateral margin of the pronotum, by the simple elytral declivity that is entirely unarmed, and by other characters.

Female.- Length $1.8-2.1 \mathrm{~mm}, 2.5$ times as long as wide; color dark reddish brown, pronotum frequently of lighter color.

Frons moderately concave from eye to eye, from epistoma to very slightly above upper level of eyes; surface smooth, shining, punctures very fine, rather dense, uniformly distributed; vestiture of rather abundant, fine, moderately long hair of about equal length, slightly longer at margins. Eye very coarsely faceted. Antennal club 1.6 times as long as wide; larger, subreniform; sutures 1 and 2 parallel, complete, almost straight, 1 finely septate; tuft of hair on posterior face attaining apex of club.

Pronotum 1.05 times as long as wide; sides almost straight and parallel on basal half, rather narrowly rounded in front; anterior margin serrate, median pair often larger; basic sculpture as in retusus Wood. Glabrous.

Elytra 1.3 times as long as wide, 1.4 times as long as pronotum; disc smooth, shining, irregular lines usually evident, punctures fine, shallow, moderately abundant, about four times larger than those on pronotal disc. Declivity convex, rather steep; striae 1 and 2 finely punctured, 1 somewhat impressed, interstriae 1 weakly elevated, 2 weakly impressed; 3 on a broadly rounded summit, with two or three fine punctures (rarely minutely granulate); surface brightly shining. Vestiture confined to declivity, of very sparse, moderately long hair in interstrial rows.

Male. - Similar to female except frons convex, sparsely, coarsely punctured, subglabrous; antennal club smaller, less irregular; anterior margin of pronotum armed by two large, median teeth.

Distribution.- Guatemala to Panama.
Guatemala: Cerro Zunil, G. C. Champion; Palín, Esquintla, 19-V-64, 300 m , No. 588, Anonillo, S. L. Wood; Volcán de Agua, 19-V-64, 1000 m , No. 615, Acacia, S. L. Wood. COSTA RICA: 16 km SE Cartago, Cartago, 24-IX-64, 1800 m , No. 244, Miconia globuliflora, S. L. Wood; Peralta, Cartago, 10-III-64, 500 m , No. 462, woody vine, S. L. Wood; Tapantí, Cartago, 2-VII63, 24-X-63, 1300 m , No. 7, woody vine, No. 24I, Phoebe mexicana, S. L. Wood; Turrialba, 5-VI1-63, 700 m , No. 23, Crotolaria, S. L. Wood; Pandora, Limón, 23-VII-63, 50 m , Nos. 144, 150, woody vine and tree branch, S. L. Wood; Finca La Lola, Limón, VII-63, Theobroma cacao, J. L. Saunders. PANAMA: 13 km S El Hato del Volcán, Chiriquí, 7-I-64, 1000 m , No. 371, tree sapling, S. L. Wood.

Hosts.- Acacia sp., Crotolaria sp., Miconia globuliflora, Phoebe mexicana, Theobroma cacao, etc.

Biology.-Specimens were taken in recently cut stems about $3-5 \mathrm{~cm}$ in diameter.

Notes. - The above treatment was based on the holotype of collaris and 43 other specimens from Guatemala, and on the type series of 109 specimens of splendens from Costa Rica and Panama. The northern and southern material is distinguishable and may represent geographical races; however, because the differences are slight and because specimens from intermediate localities are not at hand, the two forms were placed in synonymy. It is possible that punctatus Eggers, from Bolivia, is also a synonym.

## 13. Corthylus simplex Wood

Corthylus simplex Wood, 1974, Great Basin Nat. 34:187 (Holotype, female; Cerro de la Muerte, San José, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from rubricollis Blandford by the characters of the elytral declivity and of the female frons as indicated below.

Female.- Length $2.7-3.0 \mathrm{~mm}, 2.4$ times as long as wide; color black.

Frons as in rubricollis except punctures larger, vestiture coarser, slightly less abundant, slightly longer, broad median line on upper third impunctate and glabrous. Antennal club 1.3 times as long as wide; sutures 1 and 2 slightly procurved, parallel, clearly marked; tuft of hair on posterior face extending about half club length beyond apex.

Pronotum and elytra as in rubricollis except upper two-thirds of declivity more gradual, declivital interstriae 2 less strongly impressed, strial punctures much smaller, declivital bristles (when present) about twice as long.

Male.- Simiar to female except frons convex, reticulate, punctures fine, sparse, subglabrous.

## Distribution.- Costa Rica.

COSTA RICA: Cerro de la Muerte, San José, 6-Vill$63,3100 \mathrm{~m}$, No. 111, tree seedling, S. L. Wood; Volcán Poás, Heredia, $2500 \mathrm{~m}, 14-\mathrm{VII}-63$, No. 46, Podocarpus oleifolius, 19-XI-63, No. 262, tree branch, S. L. Wood.

Notes.- The above treatment was based on the type series of nine specimens.

## 14. Corthylus rubricollis Blandford Fig. 222

Corthylus rubricollis Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):260 (Lectotype, female; Volcán de Chiruquí, Chiriquí, Panama; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from simplex Wood by characters of the elytral declivity and female frons as indicated below.

Female.- Length $2.5-3.0 \mathrm{~mm}, 2.4$ times as long as wide; color black, pronotum reddish brown.

Frons reddish brown, shallowly concave from eye to eye, from epistoma to vertex; surface smooth, shining, punctures fine, rather sparse, less numerous on narrow median line; vestiture moderately abundant, of very fine, rather short hair of uniform length, indistinctly interrupted on median line. Antennal club 1.6 times as long as wide; subreniform, sutures 1 and 2 weakly procurved, partly septate; apex of club broadly rounded, indistinctly, minutely sinuate; tip of cirrus remote from apex.

Pronotum 1.0 times as long as wide; about as in collaris.

Elytra 1.4 times as long as wide, 1.4 times as long as pronotum; outline as in retusus Wood; dise smooth, shining, marked by many irregular lines, punctures moderately coarse for this genus, rather close, confused. Declivity rather steep, convex except shallowly sulcate between third interstriae; surface smooth, shining; interstriae 2 moderately, broadly impressed, 1 and 3 moderately, equally elevated; striae 1 and 2 indicated by moderately coarse, shallow punctures; interstriae with a few fine punctures in rows, some of those on 3 feebly granulate. Vestiture confined to declivity, sparse, in obscure interstrial rows, rather short, often abraded.

Male.-Similar to female except differing as indicated for male simplex.

Distribution.- Costa Rica to Panama.
COSTA RICA: 16 km SE Cartago, Cartago, 24-IX-63, 1800 m , No. 200, Myrica pubescens, S. L. Wood; Tapantí, Cartago, 1300 m, 17-IX-63, No. 184, Miconia caudata, 24-X-63, No. 245, woody vine, 26-X1-63, No. 270, Werklia insignis, S. L. Wood. PANAMA: Volcán Chiriquí.

Hosts.- Miconia caudata, Myrica pubescens, Werklia insignis, etc.

Brology.- Specimens were taken from material 4-6 cm in diameter.

Notes.- The above treatment was based on four of Blandford's 5 syntypes and on 13 other specimens.

## 15. Corthylus sanguineus Schedl

Corthylus sanguineus Schedl, 1935, Rev. de Ent. 5:346 (Holotype, female; San Isidro de Coronado, San José, Costa Rica; Schedl Coll.)
Diagnosis.- This species is distinguished from rubricollis Blandford by the slightly stouter body form, by the more strongly impressed declivital sulcus, and by the female frons and antennal club as described below.

Female.- Length 2.8-3.0 mm, 2.3 times as long as wide; color reddish brown, elytra very dark brown.

Frons with contours as in rubricollis, concave area rather densely punctured, fine punctures spaced by about half diameter of a puncture; vestiture rather fine, moderately long, much more abundant than in rubricollis. Apex of antennal club much more narrowly rounded than in rubricollis and with about three to five serrations; tip of cirrus attaining apex of club.

Pronotum and elytra as in rubricollis except declivital sulcus more strongly impressed, with punctures slightly larger.

Male.-Similar to female except sexual differences as in simplex.

Distribution.- Costa Rica.
COSTA RICA: Santo Domingo, Heredia, 27-V1-38, Persea americana, F. Nevermann; (San Isidro de) Coronado (San José), 17-1-29, 1400-1500 m, im trocknem holz, F. Nevermann.

Notes.- The above treatment was based on the holotype and on two other specimens.

## 16. Corthylus panamensis Blandford

Fig. 223
Corthylus panamensis Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):259 (Lectotype, female; Volcán de Chiriquí, Chiriquí, Panama: British Mus. Nat. Hist., present designation.
Diagnosis.- This species is distinguished from consimilis Wood by the finer elytral punctures and tubercles, by the absence of an impression on declivital interstriae 2 , and by the much smaller elevated callus on the female vertex.

Female.- Length $2.8-3.0 \mathrm{~mm}, 2.0$ times as long as wide; color very dark brown.

Frons rather deeply concave from eye to eye, from epistoma to vertex, a glabrous, conspicuously elevated callus on median third extending from upper margin of concavity two-thirds of distance toward upper level of eyes; surface smooth, shining, punctures fine, close, more widely spaced near center; vestiture of fine, moderately short hair of uniform length, except glabrous on median line. Antennal club large, subreniform, 1.4 times as long as wide; sutures 1 and 2 clearly indicated, subparallel, 1 septate; tuft of hair on posterior face poorly developed, ending remote from apex.

Pronotum 0.90 times as long as wide; widest near base, sides arcuately converging toward rather broadly rounded, subserrate, anterior margin; summit indefinite, slightly behind summit; asperities on anterior slope reduced in number, very broad; posterior areas almost shining, minutely, obscurely reticulate, punctures very sparse, minute. Glabrous.

Elytra 1.1 times as long as wide, 1.4 times as long as pronotum; sides subparallel, feebly arcuate on slightly more than basal twothirds, broadly rounded behind; dise smooth, shining, punctures very small, shallow, confused. Declivity convex, steep; striae 1-3 indicated by fine, shallow punctures, 1 slightly impressed; interstriae narrowly convex, distinctly, not strongly elevated, 2 and 3 equally flat, not impressed, 2 and 3 each bearing a row of sharply pointed granules mostly on upper half, lateral interstriae with an occasional tubercle. Vestiture confined to declivity, of sparse interstrial rows of fine, long hair.

Male. - Similar to female except frons convex, reticulate, sparsely punctured, subglabrous; antennal club much smaller, less strongly asymmetrical; anterior margin of pronotum armed by two median teeth.

Distribution.- Costa Rica to Panama.
COSTA RICA: Tapantí, Cartago, $24 \times 11-63,1300 \mathrm{~m}$, No. 245 in woody vine, No. 265 in Phoebe mexicana, S. L. Wood. PANAMA: Volcán de Chiriquí, G. C. Champion.

Brology. - Specimens were taken from recently cut branches $4-8 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the six syntypes in the British Museum (Natural History) and on seven other specimens. The first syntype from Volcán de Chiriquí is here designated as the lectotype of panamensis Blandford.
17. Corthylus consimilis Wood Fig. 224

Corthylus consimilis Wood, 1974, Great Basin Nat. 34:188 (Holotype, female; 9 km NE Teziutlán, Puebla, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from panamensis Blandford by the larger elytral punctures, by the feebly impressed declivital interstriae 2 , and by the larger elevated callus on the female vertex.

Female.- Length 2.5-2.8 mm, 2.2 times as long as wide; color very dark brown.

As in fanamensis except frontal callus larger, extending from vertex to slightly be-
low upper level of eyes; elytral punctures distinctly larger, particularly on declivity, declivital interstriae 2 feebly impressed, declivital tubercles slightly larger and more widely distributed.

Male.-Similar to female except differing as in panamensis.

Distribution. - Puebla to Guatemala.
MEXICO: Puebla: 9 km NE Teziutlán, 27-VI-53, 1600 m, No. 50, 2-VII-67, Nos. 136, 140, tree branches, S. L. Wood. GUATEMALA: Volcán Pacaya, Esquintla, I-VI$64,1300 \mathrm{~m}$, No. 668, tree branch, S. L. Wood; Volcán de Agua, 19-V-64, 1000 m, No. 615, Acacia, S. L. Wood.

Biology.- Specimens were taken from branches 6 cm in diameter.

Fig. 223. Corthylus spp., female outlines from dorsal and lateral aspects (frontal setae omitted): A, B, panamensis; C, D, punctatissimus.

Notes. - The above treatment was based on the type series of 34 specimens.

Although no indications of integration between this species and panamensis are evident in the material at hand, the differences between them are not great. Future collecting might make it necessary to reduce this form to the rank of subspecies.

## 18. Corthylus nudus Schedl

Corthylus nudus SchedI, 1940, An. Esc. Nac. Cienc. Biol., Mexico I:354 (Syntypes, females; San Antonio Nexapa in Chiapas, San Jacinto in Distrito Federal, and Uruapan in Michoacán, Mexico; Schedl and Dampf colls.)
Diagnosis.- This species is distinguished from fuscus Blandford by the larger size and by the more finely punctured elytra.

Female.- Length $4.0-4.3 \mathrm{~mm}, 2.4$ times as long as wide; color very dark brown to black.

Frons moderately concave from eye to eye, from epistoma to vertex; surface almost smooth, shining, punctures fine, dense, uniformly distributed; lateral margin armed by an elongate, blunt tubercle at level of lower margin of eye; vestiture of rather dense, short, yellow hair of uniform length and distribution, except very slightly longer at margins. Antennal club large, moderately asymmetrical, 1.5 times as long as wide; sutures 1 and 2 almost straight, parallel; tuft of hair on posterior face entirely absent.

Pronotum 0.95 times as long as wide; essentially as in panamensis Blandford.

Elytra 1.4 times as long as wide, 1.6 times as long as pronotum; outline as in panamensis; discal surface smooth, shining, shallow, obscure, irregular lines moderately abundant, punctures fine, shallow, confused. Declivity steep, convex; interstriae 1 feebly elevated, lateral areas broadly convex, punctures minute, confused, interstriae 3 with about four minute granules. Vestiture confined to declivity, of very sparse, fine, short setae, apparently only on odd-numbered interstriae.

Male.- Similar to female except frons convex, smooth, punctured, subglabrous; antennal club smaller; anterior margin of pronotum armed by two coarse, median teeth.

Distribution.- Michoacán and Distrito Federal to Chiapas.

MEXICO: Chiapas: San Antonio Nexapa, Dampf. Distrito Federal: Mexico City, 19-III-53, flight. Mexico: Chapingo, 5-1-57, R. Coronado. Michoacán: Uruapan, Dampf.

Notes. - The above treatment was based on my female homotype and on two males.

## 19. Corthylus granulatus Schedl

Corthylus granulatus Schedl, 1935, Rev. de Ent. 5:345 (Holotype, female; Turrialba, Costa Rica; SchedI Coll.)
Diagnosis.- This species is distinguished from fuscus Blandford by the stouter body form, by the more nearly confused interstriae at the base of the disc, and, in the female, by the slightly different frons as described below.

Female.- Length $3.1 \mathrm{~mm}, 2.06$ times as long as wide; color dark brown.

Frons as in fuscus except lateral margin of concave area very narrowly separated from inner margin of eye (in fuscus lateral margin touches eye, without a subtuberculate callus on lateral margin just above level of antennal insertion; surface with punctures slightly larger, slightly less abundant; vestiture much finer, less abundant, slightly shorter. Antenna as in fuscus.

Pronotum and elytra as in fuscus except as noted in diagnosis.

Distribution.- Costa Rica.
COSTA RICA: Turrialba, 800 m , Schild.
Notes.- The above treatment was based on the holotype.

## 20. Corthylus fuscus Blandford

Corthylus fuscus Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):262 (Syntypes, female; Brazilian tobacco intercepted at Paris; British Mus. Nat. Hist.)
Diagnosis.- This species is distinguished from punctatissimus (Zimmermann) by the less strongly convex elytral declivity and by the much smaller punctures on the elytral declivity.

Female. - Length $3.3-3.6 \mathrm{~mm}, 2.3$ times as long as wide; color very dark brown.

As in nudus Schedl except punctures on elytral dise slightly larger; punctures on elytral declivity small, in strial rows, with a few interstrial punctures, granules essentially obsolete on interstriae 3.

Male.- Similar to female except sexes differing as in nudus.

Distribution.- Distrito Federal in Mexico to El Salvador.

MEXICO: Distrito Federal: Mexico City, 28-1X-24, Pyrus. Mexico: Amecameca, XI-52, Malus, R. Coronado. GUATEMALA: Palín, Esquintla, 19-V-64, 300 m , No. 588, Anonillo, S. L. Wood. El SALVADOR: Volcán San Salvador, 7-IX-35, Coffea, F. Choussay.

Biology.- Specimens were taken from a recently cut branch 7 cm in diameter.

Notes.- The above treatment was based on two syntypes in the British Museum (Natural History) and on nine other specimens.

## 21. Corthylus punctatissimus (Zimmermann)

 Fig. 223Crypturgus punctatissimus Zimmermann, I868, Trans. Amer. Ent. Soc. 2:144 (Syntypes?: South Carolina, not located)
Diagnosis.- This species is distinguished from fuscus Blandford by the more strongly convex elytral declivity and by the coarser punctures on the elytral declivity.

Female.- Length $3.0-3.3 \mathrm{~mm}, 2.2$ times as long as wide; color very dark brown.

As in fuscus except punctures on elytral dise larger and deeper; elytral declivity with punctures as large or larger than on disc, much larger than in fuscus, punctures almost always in discernible rows.

Male.-Similar to female except sexes differing as in nudus Schedl.

Distribution.- Colorado and Ontario to Arkansas and North Carolina.

CANADA: Ontario: Sebringville in Perth Co. USA: Arkansas: Bradley Co. Colorado: Ft. Collins; 2 miles W Bellvue in Larimer Co. Connecticut: Winnipauk. District of Columbia: Washington. Illinois: Hancock Co. Kentucky: Noble. Michigan: Midland Co. Minnesota: Minnetonka Lake. New Hampshire: Exeter. New Jersey: Locust Grove, Summerset. New York: Attica, New York. North Carolina: Gray Beard Mt., Lake Junaluska, Mt. Pisgah, Pink Beds, Pisgah Forest. Ohio: Clinton, Delaware Co., Tuscarawas Co., Maumee. Pennsylvania: Frasier. Rhode Island: Watch Hill. Tennessee: McMinnville, Nashville. Virginia: Cape Hew, Falls Church, Nelson Co., Mt. Solon. West Virginia: Monongalia Co., Morgantown.

Hosts.-Acer sacharinum, Berberis sp., Cercocarpus sp., Gaylussacia sp., Rhododendron sp., Sassafras sp., Viburnum betuloides.

Biology.- Small trees or shrubs are attacked on or near the ground level. In larger stems the gallery system is transverse; in smaller stems it tends to spiral upward or downward into the root.

Notes.- The type was not located. My identification of this species was based on the material in the U.S. National Museum of Natural History studied by Schwarz and Hopkins.

## 22. Corthylus brunnescens Wood Fig. 224

Corthylus brunneus Wood, 1974, Great Basin Nat. 34:188 (Holotype, female; Volcán Barba, Heredia, Costa Rica; Wood Coll.). Preoccupied
Corthylus brunnescens Wood, 1981, Great Basin Nat. 41:122. Replacement name
Diagnosis.- This species is distinguished from calamicolens Wood by the smaller size, by the more slender body form, by the much more coarsely serrate anterior margin of the pronotum, and by the setal characters indicated below.

Female. - Length $3.0-3.3 \mathrm{~mm}, 2.4$ times as long as wide; color dark brown, discal area of elytra lighter.

Frons as in punctatissimus (Zimmermann) except vestiture more abundant and slightly longer on margins of lower half. Antennal club very large, strongly subreniform, suture 1 weakly, 2 moderately procurved; tuft of hair on posterior face large, its tip reaching apex.

Pronotum as in punctatissimus except anterior margin very coarsely serrate, median serrations larger.

Elytra as in punctatissimus except discal punctures slightly smaller, declivity not as steep, more broadly convex, punctures much less numerous, very fine, confused except on striae 1 , about four minute granules on interstriae 1 ; ventrolateral margin of declivity with a low, short, subacute carina extending from costal margin toward interstriae 8 . Vestiture fine, hairlike, sparse, not confined to declivity, mostly restricted to odd-numbered interstriae except on sides, rather sparse on interstriae 8 and 9 and not longer than elsewhere.

Male. - Similar to female except frons convex, subshining, sparsely, coarsely punctured; median pair of serrations on anterior margin of pronotum larger.

Distribution.- Costa Rica.
COSTA RICA: Volcán Poás, 19-XI-63, 2500 m , No. 258, native bamboo, S. L. Wood.

Biology. - Specimens were taken from the nodes of recently cut bamboo about 7 cm in diameter.

Notes.- The above treatment was based on the type series of 15 specimens.
23. Corthylus calamicolens Wood

Corthylus calamicolens Wood, 197.4, Great Basin Nat. 34:189 (Holotype, female; Volcán Poás, Heredia, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from brunnescens Wood by the larger size,
by the stouter body form, by the much more finely serrate anterior margin of the pronotum, and by the setal characters indicated below.

Female.- Length $3.7-4.0 \mathrm{~mm}, 2.3$ times as long as wide; as in brunnescens except anterior margin of pronotum finely serrate, elytral declivity more broadly convex, and vestiture along sides of elytra much more abundant and longer.

Male.-Similar to female except differing as in male brunnescens.

Distribution.- Costa Rica.

Fig. 224. Corthylus spp., female outlines from dorsal and lateral aspects (frontal setae omitted): A, B, consimilis; C, D, brunnescens.

COSTA RICA: Finca Vota Steinworth on south slope Volcán Barba, Heredia, 8-11-65, native bamboo, J. B. Karren; Volcán Poás, Heredia, 19-X1-63, 2500 m , No. 258, native bamboo, S. L. Wood.

Biology.-As in brunnescens.
Notes.- The above treatment was based on the type series of 14 specimens.

## 24. Corthylus comatus Blandford Fig. 225

Corthylus comatus Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):258 (Holotype, female; Cerro Zunil, Guatemala; British Mus. Nat. Hist.)
Corthylus splendidus Bright, 1972, Canadian Ent. 104:1371 (Holotype, female; 5.6 km or 3.5 miles S Suchixtepec, Oaxaca, Mexico; Canadian Nat. Coll., 12641); Wood, 1974, Great Basin Nat. 34:279. Synonymy
Diagnosis.- This species is distinguished from brunnescens Wood by the uniformly darker color, by the more finely serrate anterior margin of the pronotum, by the slightly larger elytral punctures, and by the weakly impressed declivital interstriae 2.

Female.- Length $2.3-3.3 \mathrm{~mm}, 2.3$ times as long as wide; color uniformly dark brown to black.

As in brunnescens except elytral punctures slightly larger, declivity more broadly convex, declivital interstriae 2 feebly to weakly impressed, punctures of striae 1 and 2 usually clearly impressed, in rows, interstriae 2 usual-
ly without punctures, interstriae 3 with about four minute granules. Vestiture largely confined to declivity, of sparse, rather short hair on odd-numbered interstriae.

Male. - Similar to female except frons convex, mostly shining; antennal club smaller, only slightly asymmetrical, without tuft of hair on posterior face; median pair of serrations on anterior margin of pronotum much larger.

Distribution.- Puebla to Panama.
MEXICO: Puebla: 9 km NE Teziutlán, 27-VI-53, 2-VII-67, tree branches, S. L. Wood. Oaxaca: 5.6 km S Suchixtepec, 2-V11-71, 2600 m , Alnus, D. E. Bright. GUATEMALA: Volcán Pacaya, Esquintla, 1-V1-64, 1300 m, Nos. 683, 695, tree branches, S. L. Wood; Volcán Zunil, Quezaltenango, 27-V-64, 1000 m , No. 627, tree seedling, S. L. Wood. COSTA RICA: Tapantí, Cartago, 24-X-63, 1300 m , No. 241, Phoebe mexicana, S. L. Wood; 16 km SE Cartago, Cartago, 24-1X-63, 1600 m , No. 198 in Solanum torvum, No. 196 in a woody vine, S. L. Wood; Volcán Poás, Heredia, 19-1X-63, 2500 m , No. 259 in Miconia. No. 260 in a tree branch, S. L. Wood. PANAMA: Cerro Punta at Volcán de Chiriquí, Chiriquí, 11-1-64, 1600 m , No. 426 in Ochroma, Nos. 396, 425, tree branches, S. L. Wood.

Hosts.-Alnus sp., Miconia sp., Ochroma sp., Phoebe mexicana, Solanum torvum, etc.

Biology. - This species breeds in recently cut or broken branches about $4-8 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotypes of comatus and splendidus

Fig. 225. Corthylus spp., female outlines from dorsal and lateral aspects (frontal setae omitted): A, B, comatus; C, D , diligens.
and on 121 other specimens. Specimens from Mexico and Costa Rica taken at elevations of 1300 m tend to be smaller than those from Guatemala, Costa Rica, and Panama taken at 1600-2500 m.

## 25. Corthylus strigilis Wood

Corthylus strigilis Wood, 1974, Great Basin Nat. 34:189 (Holotype, female; 16 km SE Cartago, Cartago. Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from comatus Blandford by the more deeply impressed declivital interstriae 2 , by the much less closely, more coarsely punctured female frons, by the very small tuft of hair on the posterior face of the female antennal club, and by the finely serrate apical margin of the female antennal club.

Female.- Length $2.7-3.1 \mathrm{~mm}, 2.3$ times as long as wide; color dark brown.

Frons as in comatus except less deeply concave, sparsely, less uniformly punctured, an indistinct median callus on upper third, vestiture much more sparse, very fine, absent on callus. Antennal club 2.8 times as long as wide, large, rather strongly asymmetrical; sutures 1 and 2 indicated by grooves, weakly procurved; tuft of hair on posterior face very small, ending remote from apex.

Pronotum and elytral dise as in comatus. Elytral declivity as in comatus except interstriae 2 more strongly impressed, 1 more strongly elevated, half as high as wide, lateral convexities more narrowly rounded.

Male.-Similar to female except differing as in comatus.

Distribution.- Costa Rica and Panama.
COSTA RICA: 16 km SE Cartago, Cartago, 24-IX-63, 1800 m , No. 204 in Miconia globuliflora, No. 205 in Myrica pubescens, S. L. Wood; Tapantí, Cartago, 1300 m , 2-VlI-63, No. 5, Miconia, 17-IX-63, No. 176, tree limb, 24-X-63. Nos. 24I. 265, Phoebe mexicana, No. 26-X1-63, No. 27I, Werklia insignis, S. L. Wood. PANAMA: Cerro Punta at Volcán de Chiriquí, Chiriquí, 11-1-64, No. 393 in a tree branch, No. 407 in a tree seedling, No. 426 in Ochroma, S. L. Wood.

Hosts.-Cercropia sp., Miconia globuliflora, Myrica pubescens, Ochroma sp., Phoebe mexicana, Werklia insignis.

Biology.- Specimens were taken from material $3-6 \mathrm{~cm}$ in diameter.

Notes.- The abcve treatment was based on the type series of 68 specimens.

## 26. Corthylus diligens Wood

Fig. 225
Corthylus diligens Wood, 1974, Great Basin Nat. 34:190
(Holotype, female; Volcán de Agua, Esquintla, Guatemala; Wood Coll.)
Diagnosis.- This species is distinguished from comatus Blandford by the much more deeply impressed declivital interstriae 2 and by characters of the female frons and antennal club as indicated below.

Female.- Length 2.5-2.6 mm, 2.4 times as long as wide; color brown.

Frons as in comatus except concave area more broadly oval, 1.2 times as long as wide ( 1.4 times in comatus); tuft of hair on posterior face of antennal club with tip ending remote from apex. Pronotum as in comatus except anterior margin more coarsely serrate; punctures on disc minutely, obscurely granulate. Elytra as in comatus except declivity more strongly impressed on interstriae 2 , suture not as high, lateral convexities higher and more narrowly rounded.

Male.-Similar to female except sexual differences as in comatus.

Distribution.-Guatemala.
GUatemala: Volcán de Agua, Esquintla, I9-V-64, 1000 m , No. 593, in Clusia, No. 600 in A/nus; Lago Amatitlan, 10-VI-64, 700 m , No. 705, tree branch; Palín, Esquintla, 19-V-64, 300 m , No. 687, Ficus; all by me.

Hosts.- Alnus sp., Clusia sp., Ficus sp., etc.

Biology.- Specimens were taken from branches $3-5 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 10 specimens.

## 27. Corthylus zelus Wood

Fig. 226
Corthylus zelus Wood, 1974, Great Basin Nat. 34:190 (Holotype, female; Cerro de la Muerte, San José. Costa Rica: Wood Coll.)
Diagnosis.- This species is distinguished from diligens Wood by the larger size and by characters of the female frons and antennal club as indicated below.

Female.- Length $3.4-3.5 \mathrm{~mm}, 2.5$ times as long as wide; color very dark brown.

Frons similar to diligens except concave area less strongly impressed, upper margin not clearly delimited; frontal vestiture longer. Tuft of hair on antennal club with its tip almost attaining apex. Anterior margin of
pronotum less coarsely serrate. Elytral declivity with punctures on striae 1 in a row, shallow, of moderate size; lateral punctures much smaller.

Male.-Similar to female except sexual differences as in comatus.

Distribution.- Costa Rica.
costa rica: Cerro de la Muerte, San José, 6-VIII$63,2500 \mathrm{~m}$, No. 114, Brunellia costricensis, S. L. Wood.

Biology.- Specimens were taken from a limb 10 cm in diameter.

Notes.- The above treatment was based on the type series of three specimens. One male from 16 km SE Cartago, Cartago, at 1800 m , and another from Tapantí, Cartago, at 1300 m , have the declivital sulcus narrower and deeper, and the lateral punctures almost obsolete; they possibly could also

Fig. 226. Corthylus spp., female outlines from dorsal and lateral aspects (frontal and antennal setae omitted); A, B, zelus; $\mathrm{C}, \mathrm{D}$, columbianus.
represent this species or a very closely related one not yet known from the female.

## 28. Corthylus ptyocerus Blandford

Corthylus ptyocerus Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):257 (Lectotype, female: Volcán de Chiriquí, Chiriquí, Panama: British Mus. Nat. Hist., present designation)
Diagnosis.- This species is distinguished from the remotely related concavus Bright by characters summarized in the above key.

Female.- Length $3.9-4.2 \mathrm{~mm}, 2.0$ times as long as wide; color black.

Frons deeply concave and punctured as in concavus Bright, with a conspicuous subcarinate, impunctate median callus from epistoma to vertex; lateral margins at level of antennal insertions, and median line at epistoma and again slightly above epistoma subtuberculate; vestiture of abundant, fine, short hair of uniform length. Antennal club large, subtriangular, apical margin almost straight; cirrus not attaining subacute mesal apical angle.

Pronotum 0.94 times as long as wide; essentially as in concavus.

Elytra 1.2 times as long as wide; 1.3 times as long as pronotum; sides weakly arcuate and subparallel on basal half, arcuately converging, then broadly rounded behind; about as in concavus except striae 1 and 2 more coarsely punctured, interstriae 2 slightly narrower and more deeply impressed, interstrial tubercles at base of declivity distinctly larger, including one or two tubercles on interstriae 2.

Male.-Similar to female except sexual differences as in concavus.

## Distribution.- Panama.

Panama: Volcán de Chiriquí, Chiriquí, $25-4000 \mathrm{ft}$, G. C. Champion.

Notes.- The above treatment was based on four syntypes. The first syntype, a female, has been regarded as the type; it is here designated as the lectotype of ptyocerus Blandford.

## 29. Corthylus columbianus Hopkins Fig. 226

Corthylus columbianus Hopkins, 1894, Proc. Ent. Soc. Washington 3:104 (Syntypes; Raleigh Co., West Virginia; U.S. Nat. Mus.)

Diagnosis.- This species is distinguished from zelus Wood by the larger size, by the absent of a tuft of hair on the posterior face of the female antennal club, by characters of the female frons, and by other features.

Female.- Length 3.6-3.8 mm, 2.4 times as long as wide; color very dark brown to almost black.
Frons shallowly, broadly concave from elevated epistoma to vertex; lateral margin with a rounded tubercle at inner margin of eye; surface smooth, densely, finely, uniformly punctured; vestiture of rather short, fine, dense, erect hair uniformly distributed. Antennal club moderately asymmetrical, 1.4 times as long as wide, sutures 1 and 2 almost straight; posterior face without a specialized tuft of hair.

Pronotum and elytral disc essentially as in punctatissimus except elytral punctures less abundant and less sharply impressed. Elytral declivity with punctures on striae 1 and 2 essentially in rows; interstriae 2 moderately impressed, rather strongly narrowed, 3 with about six distinct tubercles, 1 usually with smaller tubercles. Vestiture sparse, confined to declivity.

Male.-Similar to female except frons convex, punctured, sparsely pubescent; antennal club smaller, less strongly asymmetrical.

Distribution.- Kansas and Massachusetts to Tennessee and Georgia.

USA: District of Columbia: Washington. Georgia: Green Co. Kansas: Shawnee Co. Maryland: Berwyn, Piscataway, Riderwood. Missouri: Dent Co. New Jersey: Cranford, Ocean Country, Riverton. New York: New Rochelle. North Carolina: Washington. Tennessee: Elkmont. Virginia: Elkins, Falls Church, Ft. Monroe. West Virginia: Rickene, Randolph Co.

Hosts.-Acer rubrum, A. saccharinum, Castanea dentata, Liriodendron tulipifera, Platanus occidentalis, Quercus alba, Ulmus sp.

Brology.- The bole of living trees is selected for attack and the tree usually survives after the brood has emerged. The life cycle and habits are discussed by Kabir and Giese (1966).

Notes.- The above treatment was based on 47 specimens, including Hopkins's syntypes.

## 30. Corthylus concavus Bright

Corthylus concavus Bright, 1972, Canadian Ent. 104:1376 (Holotype, female; 24 km or 15 miles S Valle Nacional, Oaxaca, Mexico; Canadian Nat. Coll., 12647)
Diagnosis.- This space is distinguished from columbianus Hopkins by characters of the female frons and elytral declivity as indicated below.

Female.- Length 3.4-3.9 mm, 2.2 times as long as wide; color black.

Frons as in columbianus except much more strongly concave, vestiture on margin much longer; sutures of antennal club feebly procurved. Pronotum and elytral disc as in columbianus except punctures smaller, not as deep. Elytral declivity as in columbianus except interstriae 2 more strongly, more broadly impressed, punctures much smaller.

Male.-Similar to female except sexual differences as in columbianus.

Distribution.- Puebla to Oaxaca.
MEX1CO: Oaxaca: 24 km or 15 miles $S$ Valle Nacional, 20-V-71, 1300 m , D. E. Bright. Puebla: 9 km NE Teziutlán, 2-VII-67, 1600 m , No. 135 in Alnus, No. 140 in tree limb, S. L. Wood.

Biology.- Specimens were taken from limbs and a seeding $5-12 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the holotype and on 12 other specimens.

## 31. Corthylus trunculus Wood

Corthylus trunculus Wood, 1974, Great Basin Nat. 34:191 (Holotype, female; 13 km or 8 miles S El Hato del Volcán, Chiriquí, Panama; Wood Coll.)
Diagnosis.- This unique species is distinguished from all other representatives of the genus by the small size, by the truncate elytral declivity that is armed at its base by a pair of denticles on interstriae 3, by the convex female frons, and by the strongly procurved sutures on the female antennal club.

Female.- Length 1.3-1.4 mm, 2.2 times as long as wide; color brown.

Frons weakly convex except somewhat flattened on lower fifth; surface subreticulate, punctures small, obscure, moderately abundant; vestiture of uniformly distributed moderately long hair from epistoma almost to vertex. Antennal club subtriangular, more nearly symmetrical than normal for this genus, 1.1 times as long as wide; sutures 1 and 2 strongly procurved, 1
apparently partly septate but not showing on posterior face; posterior face with tip of small tuft of hair reaching apex.

Pronotum 1.1 times as long as wide; basically as in comatus Blandford except sculpture much finer, posterior areas strongly reticulate.

Elytra 1.2 times as long as wide; 1.1 times as long as pronotum; sides almost straight on basal five-sixths, very slightly narrower toward declivity, abruptly, very broadly rounded behind; dise almost smooth, subshining, points, lines, and punctures small, confused, somewhat obscure. Declivity truncate, very steep, margin from base to apex abruptly rounded, slightly elevated (not acutely margined); basal margin armed by a pair of small pointed spines at interstriae 3; sutural interstriae uniformly, subacutely, rather weakly elevated; surface strongly reticulate, punctures abundant, confused, shallow, very obscure. Vestiture sparse, short, confined to sides and margins of declivity.

Posterior face of protibia subinflated and armed by four to six confused, minute denticles.

Male.- Similar to female except frons more strongly convex, subglabrous; antennal club normal, sutures weakly procurved, tuft of hair absent; anterior margin of pronotum armed by two or more coarse teeth.

Distribution.- Costa Rica to Panama.
COSTA RICA: Beverley, Limón, 26-V11I-63, 7 m , No. 154, woody vine, S. L. Wood. PANAMA: 13 km S El Hato del Volcán, Chiriquí, 7-1-64, 100 m , No. 371, tree seedling, S. L. Wood.

Biology.- Specimens were taken from stems $2-3 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of nine specimens.

## 32. Corthylus suturifer Schedl

Corthylus suturifer Schedl, 1963, Ent. Arb. Mus. Frey 14:165 (Holotype, female; Cordoba, Veracruz, Mexico; Schedl Coll.)
Diagnosis.- This species is distinguished from pumilus Wood by the more slender body form, by the much steeper, more broadly rounded elytral declivity, with interstriae 1 very strongly elevated, and by the different female frons.

Female.- Length $1.4 \mathrm{~mm}, 2.4$ times as long as wide; color yellowish brown.

Frons rather shallowly concave from eye to eye, from epistoma to vertex; median third smooth, shining, impunctate, lateral thirds apparently very finely granulate-punctate; lateral margins ornamented from epistoma to vertex by a row of moderately long hair (vertex concealed by pronotum, row of hair sometimes interrupted in median area). Both antennae missing from type; left antenna immersed in adjacent glue, large, without a cirrus.

Pronotum 1.05 times as long as wide; about as in pumilus except more slender.

Elytra 1.4 times as long as wide, 1.4 times as long as pronotum; sides almost straight and parallel on basal three-fourths, rather abruptly, very broadly rounded behind, with sutural interstriae interrupting outline; disc reticulate, punctures obscure, confused. Declivity confined to posterior fifth, very steep, very broadly convex; interstriae 1 very strongly, uniformly elevated, higher than wide at middle of declivity, its crest reticulate-granulate; lateral areas reticulate, weakly convex; interstriae 3 with about three small denticles; posterolateral margin subacutely, rather weakly elevated on lower third, upper twothirds of margin rounded. Vestiture confined to declivital interstriae 2,3 , and 4 , consisting of rows of rather short, very stout setae.

Distribution.-Veracriz.
MEXICO: Veracruz: Cordoba.
Notes.- The above treatment was based on the holotype.

## 33. Corthylus minimus Wood

Corthylus minimus Wood, 1974, Great Basin Nat. 34:192 (Holotype, female; La Ceiba, Honduras; Wood Coll.)
Diagnosis.- This species is distinguished from minutissimus Schedl by the characters of the head and elytral declivity as indicated below.

Female.- Length $1.3-1.4 \mathrm{~mm}, 2.3$ times as long as wide; color brown.

Frons very narrow, very shallowly concave, on central half, impressed areas not attaining upper level of eyes; surface shining, obscurely reticulate, a few punctures in marginal areas; subglabrous. Eyes very large, coarsely faceted. Antennal club 1.5 times as long as wide, moderately asymmetrical;
sutures almost straight, 1 partly septate, 2 very obscure; posterior face without a tuft of hair.

Pronotum and elytra essentially as in minutissimus except elytral declivity with interstriae 2 narrowed, moderately impressed, 1 carinate, more strongly elevated, 3 distinctly elevated and armed by about four minute tubercles, 2 without setae.

Male.- Similar to female except frons convex, rugose-reticulate, punctures more uniformly distributed; eyes of normal size; antennal club smaller, less elongate; anterior margin of pronotum armed by a pair of coarse, median teeth.

Distribution.- Honduras.
honduras: La Ceiba, Atlántida, 20-V to 26 -VIII49, at light, E. C. Becker.

Notes.- The above treatment was based on the type series of 17 specimens.

## 34. Corthylus pumilus Wood

Corthylus pumilus Wood, 1974, Great Basin Nat. 34:192 (Holotype, female; Madden Forest, Canal Zone, Panama; Wood Coll.)
Diagnosis.- This species is distinguished from minutissimus Schedl by characters of the frons and elytral declivity as indicated below.

Female.- Length $1.5-1.8 \mathrm{~mm}, 2.2$ times as long as wide; color brown.

Frons broadly, deeply concave from epistoma to vertex; surface evidently minutely, densely punctured and finely, densely, uniformly pubescent except smooth and glabrous on narrow median area on upper fourth; vestiture rather short, of uniform length. Antennal club 1.4 times as long as wide; strongly reniform, with grooved sutures, and with a small tuft of hair on posterior face as in minutissimus.

Pronotum and elytra as in minutissimus except elytral declivity with interstriae 1 more strongly elevated, 2 weakly impressed, entirely unarmed, and devoid of setae, 4 feebly elevated and armed by about four minute tubercles. Vestiture as in minutissimus except more slender, slightly longer, absent on interstriae 2.

Male. - Similar to female except frons convex, reticulate, subglabrous; antennal club normal, anterior margin of pronotum armed by a pair of coarse, median teeth.

Distribution.- Panama.

PANAMA: Ft. Clayton, Canal Zone, 22-X11-63, 30 m , No. 363, tree branch, S. L. Wood; Madden Forest, Canal Zone, 2-I-64, 70 m , No. 366, tree branch, S. L. Wood.

Biology.- Specimens were taken from branches 2.3 cm in diameter.

Notes.- The above treatment was based on the type series of 18 specimens.
35. Corthylus nevermanni (Schedl)

Thylurcos nevermanni Schedl, 1939, Mitt. Münchner Ent. Ges. 29:568 (Holotype, male; Hamburgfarm on Río Reventazón, Limón, Costa Rica; Schedl Coll.)
Diagnosis. - The male is distinguished from the male of pumilus Wood by the more slender body form and by the more gradual elytral declivity that has interstriae 1 less distinctly elevated, interstriae 2 wider and not impressed, and the punctures more distinctly impressed.

Male.- Length 1.7 mm , 2.4 times as long as wide; color brown.

Frons convex above eyes, rather strongly, transversely impressed below eyes, epistoma distinctly elevated; surface reticulate, punctures fine, rather sparse; vestiture of fine, long, rather sparse, uniformly distributed hair.

Pronotum 1.1 times as long as wide; sides almost straight and parallel on more than basal half, then abruptly rounded, rather narrowly rounded in front; anterior margin armed by about six serrations, median pair slightly larger; anterior third strongly declivous, moderately asperate, asperities near median line continued to middle of pronotum but of reduced size; posterior areas finely reticulate, punctures sparse, minute.

Elytra 1.3 times as long as wide, 1.2 times as long as pronotum; sides almost straight and parallel on basal two-thirds, rather narrowly rounded behind; surface smooth, shining, with a few very obscure, fine lines, punctures minute, confused. Declivity convex, moderately steep; suture weakly elevated on middle half, interstriae 2 not impressed; punctures fine, larger than on disc, distinctly impressed, granules on 1 and 3 very fine, rounded at base of setae. Vestiture consisting of sparse interstrial rows of moderately long, coarse hair on odd-numbered declivital interstriae and on basal half of 2 .

Posterior face of protibiae with a few very minute tubercles.

Distribution.- Costa Rica.
COSTA RICA: Hamburgfarm, Río Reventazón, Limón, l-V-34, F. Nevermann.

Notes.- The holotype apparently was taken at light. The elytra of the type are spread very slightly. This condition was interpreted and illustrated by Schedl as a sutural emargination. Actually, the elytra are entire, with no hint of an emargination.

## 36. Corthylus nanus Wood

Corthylus nanus Wood, 1979, Great Basin Nat. 39:138 (Holotype, male; 1 km S Rincón de Osa, Puntarenas, Costa Rica; Wood Coll.)
Diagnosis. - The unique male is unrelated to known species, but it is distinguished from pumilus Wood by the smaller, more slender form, by the shining, weakly reticulate frons, and by the very different elytra.

Male.- Length $1.2 \mathrm{~mm}, 2.5$ times as long as wide; color reddish brown.

Frons broadly convex, a feeble median granule at epistoma; surface shining, reticulate, very weakly so above upper level of eyes; vestiture fine, inconspicuous.
Pronotum 1.1 times as long as wide; basically as in minutissimus Schedl except anterior margin armed only by two slender, contiguous, median serrations; surface reticulate.

Elytra 1.4 times as long as wide, 1.3 times as long as pronotum; sides almost straight and parallel on basal two-thirds, rather broadly rounded behind; surface smooth, brightly shining, punctures minute, almost obsolete, perhaps in obscure strial rows. Declivity steep, convex; striae obscurely evident, punctures more distinct than on disc; interstriae 1 weakly, distinctly elevated, 2 strongly, rather narrowly elevated from just below base to just below middle, its narrowly convex crest uniformly elevated, with a row of small punctures, 3 neither elevated nor impressed, with a row of punctures, punctures on 1-3 possibly very feebly granulate. Vestiture restricted to declivity, of interstrial rows of subspatulate bristles on all interstriae, about 5-6 on each interstriae, each bristle about one and one-half times as long as distance between rows.

Distribution.- Costa Rica.

COSTA RICA: 1 km SW Rincón de Osa, Puntarenas, 12-VIII-68, from a Cecropia leaf petiole, H. Hespenheide.

Notes.- The above treatment was based on the holotype.

## 37. Corthylus minutissimus Schedl

Corthylus minutissimus Schedl, 1940, An. Esc. Nac. Cienc. Biol., Mexico 1:353 (Syntypes, females; Chiltepec, Oaxaca, Mexico; Schedl and Dampf colls.)
Diagnosis.- This species is distinguished from pumilus Wood by the characters of the frons and declivity as indicated below.

Female.- Length $1.2-1.4 \mathrm{~mm}, 2.2$ times as long as wide; color brown.

Frons broadly, rather deeply concave from epistoma to vertex, with a transverse callus near upper limits of impressed area; margin from level of antennal insertion to inner margin of eye subacute; surface of impressed area finely reticulate, minute punctures very obscure; vestiture of very fine, sparse hair or entirely abraded. Antennal club 1.5 times as long as wide, as in pumilus.

Pronotum 0.98 times as long as wide; about as in trunculus Wood.

Elytra 1.25 times as long as wide, 1.25 times as long as pronotum; sides straight and parallel on basal half, broadly rounded behind; dise shining, points, punctures, and lines minute, obscure, confused. Declivity broadly convex, steep; posterolateral margin subacutely, rather weakly elevated from costa (in line with striae 3) to about interstriae 8; interstriae 1 distinctly, weakly costate, a few granules feebly, indistinctly indicated, 2 and 3 each with a row of about four to six tubercles of about equal size; striae 1 and 2 not impressed, their punctures small, weakly impressed, apparently in rows. Vestiture of interstrial rows of bristles mostly on declivity; each bristle erect, short, stout, flattened, about four to six times as long as wide.

Protibia as in trunculus.
Distribution.- Oaxaca to Honduras.
MEXICO: Oaxaca: Chiltepec, 3 -111-32, at light, A. Dampf. HONDURAS: La Lima, Cortéz, 5-V-64, 200 m , No. 574, Swietenia, S. L. Wood.

Biology.- Specimens were taken from branches $2-3 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on 12 specimens, of which one was compared by me to Schedl's syntype.

## 38. Corthylus uniseptis Schedl

Corthylus uniseptis Schedl, 196I, Pan Pacific Ent. 34:229 (Holotype, male; Cordoba, Veracruz, Mexico; California Acad. Sci.)
Corthylus reburrus Bright, 1972, Canadian Ent. 104:1375 (Holotype, female; Palenque Ruins, Chiapas, Mexico; Canadian Nat. Coll.); Wood, 1974, Great Basin Nat. 34:280. Synonymy
Diagnosis.- This species is distinguished from trucis Wood by the smaller size, by the unarmed declivital interstriae 2 , and by other characters.

Female.- Length $1.8-2.1 \mathrm{~mm}, 2.3$ times as long as wide; color very dark brown.

As in trucis except median line on frons much wider, lateral areas without longer setae; antennal club apparently more elongate; declivital interstriae 2 unarmed.

Male.-As in male trucis except elytral declivity with tubercles absent on interstriae 2, half as numerous as on 1 and 3; declivital setae half as numerous, much shorter.

Distribution.- Veracruz to Chiapas.
MEXICO: Chiapas: Palenque Ruins, 22-Vl-69, D. E. Bright. Veracruz: Cordova, A. Fenyes.

Notes.- The above treatment was based on the holotype of uniseptis and on a male paratype of reburrus. The holotype of reburrus wàs also examined.

## 39. Corthylus parvulus Blandford

Corthylus parvulus Blandford, 1904, Biol. Centr. Amer., Coleopt. $4(6): 261$ (Holotype, male; Las Mercedes, Guatemala; British Mus. Nat. Hist.)
This species is virtually identical with uniseptis Schedl except that the pronotum and elytra are smoother and without evident punctures on the elytral disc, and the declivital setae are stouter. The holotype is 1.6 mm in length. Based on the limited material at hand, I hesitate to recognize more than one species. The type, which was examined, was taken at an elevation of 3000 ft .

## 40. Corthylus trucis Wood

 Fig. 227Corthylus trucis Wood, 1974, Great Basin Nat. 34:193 (Holotype, female; 16 km SE Cartago, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from uniseptis Schedl by the larger size, by the armed declivital interstriae 2 , and apparently by other characters.

Female.- Length 2.9-3.1 mm, 2.3 times as long as wide; color dark brown, almost black.

Frons deeply concave from eye to eye, from epistoma to vertex; surface smooth, shining, finely, closely punctured except narrowly impunctate on entire median line; vestiture of fine, erect, moderately long hair of uniform length, except a few longer setae on lateral margins. Antennal club large, strongly asymmetrical, 1.25 times as long as wide, with three rather strongly procurved sutures, median half of 1 septate, cirrus extending slightly beyond apex.

Pronotum and elytral disc essentially as in comatus Blandford. Elytral declivity broadly convex, steep; posterolateral margin subacutely elevated form costal margin to interstriae 8; surface shining, impressed points rather numerous, strial punctures only slightly larger than points, mostly in rows; interstriae 1 distinctly elevated, subcostate, 2 distinctly, rather shallowly impressed, 1-3 each armed by about four to six moderately large tubercles, usually less numerous on 2. Vestiture mostly confined to declivity, of fine, long, interstrial half of moderate abundance.

Male.- Similar to female except frons convex, reticulate, sparsely punctured, subglabrous; antennal club much smaller, more nearly symmetrical, with only two sutures; anterior margin of pronotum more strongly serrate, median pair larger.

Distribution.- Costa Rica.
COSTA RICA: 16 km SE Cartago, Cartago, $24-1 \mathrm{X}-63$, 1800 m , No. 204, Miconia globuliflora, S. L. Wood.

Notes. - The above treatment was based on the type series of five specimens.

## 41. Corthylus luridus Blandford

Corthylus luridus Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):256 (Holotype, female; Volcán de Chiriquí, Chiriquí, Panama; British Mus. Nat. Hist.)
Corthylus biseriatus Eggers, 1943, Arb. Morph. Taxon. Ent. 10:247 (Holotype, female; Guatemala; 1nstitut für Pflanzenschrutzforschung Kleinmachnow)
Diagnosis.- This species is distinguished from trucis Wood by the posterior face of the female antennal club as described below and by the steeper elytral declivity with very slightly larger declivital tubercles.

Female.- Length $2.3 \mathrm{~mm}, 2.1$ times as long as wide; color brown (not fully mature).

As in trucis except posterior face of antennal club with a large, oval, impressed area occupying at least two-thirds of surface area on distal half, middle third of this impressed area occupied by a slender, transverse, spongy area extending to margins of impressed area (transverse, spongy area in trucis occupying middle third of club almost from mesal to lateral margins). Elytral declivity slightly steeper than in trucis and with interstrial tubercles slightly larger.

Distribution.-Guatemala and Panama.
guatemala: Guatemala, Conradt. Panama: Volcán de Chiriquí, 25-4000 ft, G. C. Champion.

Notes.- The above treatment was based on the holotypes of luridus and biseriatus.

## 42. Corthylus detrimentosus Schedl

Corthylus detrimentosus Schedl, 1940, An. Esc. Nac. Cienc. Biol., Mexico 1:355 (Syntypes; Sierra de Durango, Mexico; Schedl Coll.)
Diagnosis.- This species is rather similar to trucis Wood, but it is distinguished by characters of the frons, elytral declivity, and color as described below.

Female. - Length $2.5-2.7 \mathrm{~mm}, 2.4$ times as long as wide; color yellowish brown, anterior half of pronotum and posterior third of elytra dark brown.

Frons deeply, broadly concave from eye to eye, from epistoma to vertex; surface on upper two-thirds smooth, with rather coarse, very close punctures, evidently with a small median tubercle at upper margin, lower third covered almost from eye to eye by a subreniform, yellow, spongy area from epistoma almost to upper level of eyes; punctured area with fine, rather abundant, moderately long hair. Antennal club 1.3 times as long as wide, sutures 1 and 2 feebly procurved; cirrus extending slightly beyond apex of club.

Pronotum and elytral disc approximately as in comatus Blandford except minute punctures on posterior half of elytral disc mostly in strial rows. Elytral declivity about as in trucis except more strongly convex; small strial punctures in rows, interstriae 2 not impressed, 1-3 each with a row of very fine granules. Vestiture confined to declivity, of fine, rather short interstrial hair.

Male.- Similar to female except frons convex, subglabrous, subreticulate, with sparse, coarse punctures; antennal club smaller, more symmetrical, without cirrus; declivital striae 1 somewhat sulcate.

Distribution.- Durango to Guerrero.
MEXICO: Durango: Sierra de Durango; 16 km W El Salto, VII-64, J. B. Thomas; 29 km W El Salto, 7-VI-65, 2500 m, No. 35 , Arbutus, S. L. Wood. Guerrero: Ciudad Altamiran, X-1979, at light.

Biology.- Two males were taken from an Arbutus stump 10 cm in diameter.

Notes.- The above treatment was based on a female that was compared by me to the holotype, and on three males.
43. Corthylus mexicanus Schedl Fig. 227

Corthylus mexicanus Schedl, 1950, Dusenia 1:159 (Holotype, male; Comitán, Chiapas, Mexico; Schedl Coll.)
Corthylus glabinus Bright, 1972, Canadian Ent. 104:1372 (Holotype, female; 14 km or 9 miles SW Teopisca, Chiapas, Mexico; Canadian Nat. Coll., 12642): Wood. 1974. Great Basin Nat. 34:175. Synonymy
Diagnosis.- This species is distinguished from detrimentosus Schedl by conspicuous differences on the female frons and on the elytral declivity.

Fig. 227. Corthylus spp., female outlines from dorsal and lateral aspects (frontal setae omitted): A, B, mexicanus: C, D, trucis; E, F, sentus; G, H. I. pygmaeus, G. anterior face of antenna.

Female.- Length 2.3-2.5 mm, 2.3 times as long as wide; color dark brown, basal twothirds of elytra yellowish brown.

Frons with basic contours as in detrimentosus; spongy area an oval area on median fourth from epistoma to about two-thirds distance to upper level of eyes; vestiture in impressed area sparse, upper margin ornamented by a row of long, yellow hair, their tips extending beyond epistoma. Antennal club as in detrimentosus except cirrus longer.

Pronotum and elytral dise as in detrimentosus. Elytral declivity very steep, subtruncate, slightly convex; posterolateral margin subacutely elevated from apex to slightly above middle, margin rounded on upper third; strial punctures rather small, clearly impressed; interstriae 1 moderately elevated, armed by two to six rather small tubercles; 2 strongly, broadly impressed, unarmed, mostly impunctate; 3 slightly elevated on upper half and armed by about three small denticles; lateral areas occasionally with two or three small tubercles. Usually glabrous, occasional specimens with a few fine setae at base of declivity.

Male.- Similar to female except frons convex, subreticulate, sparsely, finely punctured, subglabrous; antennal club smaller, more nearly symmetrical, without a cirrus.

Distribution.- Puebla to Honduras.
MEXICO: Puebla: Huahuchinango, IV-61, Malus; 25 km W Texmelucan, 13-VI-67, 2800 m , Salix, S. L. Wood; Il km W Villa Juarez, 25-VI-53, S. L. Wood. Veracruz: 25 km NW Jacala, 29-VI-53, $2100 \mathrm{~m}, \mathrm{~S}$. L. Wood. HONDURAS: Zamorano, Morazán, I8-IV-64, Clethra hondurensis, Lippia substrigosa, Oreopanax, Parathesis serrulata, Pinus pseudostrobus, Rapanea guyanensis, S. L. Wood.

Biology.- This species breeds in material $3-5 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of glabinus and on 113 other specimens, one of which was compared by me to the holotype of mexicanus.

## 44. Corthylus nolenae Wood

Corthylus nolenae Wood, 1974, Great Basin Nat. 34:I94 (Holotype, female; Huajuapan, 21 km or 13 miles SE Oaxaca, Oaxaca, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished from detrimentosus Schedl by the smaller size, by the female frons, and by the elytral declivity as noted below.

Female.- Length $2.0-2.3 \mathrm{~mm}, 2.3$ times as long as wide; color reddish brown, elytra black.

Frons as in detrimentosus except spongy area smaller, ending well below upper level of eyes, dorsal half of excavated area with a strongly elevated median carina, marginal setae slightly longer, cirrus on antennal club smaller, shorter.

Pronotum much as in detrimentosus except pronotal disc with several broad subasperate crenulations, and elytral dise with strial punctures much larger and mostly in definite rows. Elytral declivity similar to detrimentosus but not as steep and more narrowly convex; strial punctures rather coarse, deep; interstriae 1 distinctly elevated, 3 feebly elevated on basal half, 1 and 3 each with about four to six small tubercles; ventrolateral margin as in detrimentosus.

Male.-Similar to female except sexual differences as in detrimentosus.

Distribution.- Oaxaca.
MEXICO: Oaxaca: Huajuapan, 4-VII-53, Nolena, S. L. Wood.

Habits.- Specimens were taken from a fruiting stalk about 5 cm in diameter.

Notes.- The above treatment was based on the type series of 51 specimens.

## 45. Corthylus spinosus Wood

Corthylus spinosus Wood, 1974, Great Basin Nat. 34:194 (Holotype, male; Fortín de las Flores, Veracruz, Mexico; Wood Coll.)
Diagnosis.- This species is distinguished in the male by the stouter body and by the very different elytral declivity.

Male.- Length 2.0 mm , about 2.0 times as long as wide; color very dark brown.

Frons, antenna, pronotum, and elytral disc as in uniseptis Schedl except pronotum with summit nearer base, its disc with rather numerous low, rather broad, transverse crenulations. Elytral declivity much as in uniseptis except wider, strial punctures slightly larger, interstriae 2 narrower and slightly deeper, 1 and 3 each bearing about four very coarse, sharply pointed tubercles, each higher than wide (unusually large for this genus), several smaller tubercles in lateral areas. Vestiture slightly longer and more abundant than in uniseptis.
Distribution.- Veracruz.

Mexico: Veracruz: Fortín de las Flores-Sumidero, $27-\mathrm{IV}$ - $65,900 \mathrm{~m}$, blacklight, H. M. Weems, Jr.

Notes. - The above treatment was based on the unique holotype.

## 46. Corthylus minutus Bright

Corthylus minutus Bright, 1972, Canadian Ent. 104:1373 (Holotypes, female; Lagos de las Colores, Chiapas, Mexico; Canadian Nat. Coll., 123643).
Diagnosis.- This species is distinguished from sentus Wood by the much smaller size and by details in sculpture of the female frons.

Female.- Length 1.6 mm , about 2.5 times as long as wide (elytra slightly spread on type; color very dark brown).

Frons as in sentus except yellow, spongy areas each subcircular, extending from epistoma slightly less than 60 percent of the distance to upper level of eyes, each very slightly longer than wide; margins of yellow, spongy area with a row of fine, rather long hair, hair about equal in length to half diameter of a spongy area. Pronotum and elytra as in sentus.

Distribution.-Chiapas.
MESICO: Chiapas: Lagos de las Colores, 17-V-69, Quercus, D. E. Bright.

Notes. - The above treatment was based on the holotype.

## 47. Corthylus sentus Wood

Fig. 227
Corthylus sentus Wood, 1974, Great Basin Nat. 34:195 (Holotype, female, 2 km SE Cartago, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from minutus Bright by the larger size and by characters of the female frons.

Female.- Length 2.0-2.4 mm, 2.3 times as long as wide (Costa Rica; 2.4 times in Guâtemala); color brown.

Frons strongly concave from eye to eye, from epistoma to vertex; surface of upper half almost smooth, evidently with a few minute punctures, lower half from epistoma to upper level of eyes entirely occupied by a pair of oval, yellow, spongy areas, separated by a fine, low, acute, median carina, margins of spongy areas without a row of hair in most specimens, an irregular row in others. Antennal club strongly asymmetrical, apex subacute, sutures I and 2 moderately procurved,
both partly septate at median end, a feeble suture 3 suggested; cirrus absent.

Pronotum as in uniseptis Schedl except discal area with numerous weak, broad crenulations. Elytral disc as in uniseptis except punctures more obscure; declivity about as in spinosus except punctures obsolete, interstriae 1 weakly elevated, unarmed, 2 impressed, strongly narrowed, essentially obsolete, 3 and lateral areas convex, 3 armed by about three coarse spines (larger than in spinosus), usually with one or two smaller spines at base, lateral areas with about four to eight pointed tubercles. Vestiture confined to declivity, of sparse hair.

Male.-Similar to female except frons convex, reticulate, sparse punctures obscure, antennal club smaller, less strongly asymmetrical; anterior margin of pronotum armed by one pair of median teeth.

Distribution.- Guatemala to Costa Rica.
guatemala: Cerro Peña Blanca, 23-IV-64, 2000 m , No. 529, Miconia schlechtendalii, S. L. Wood; Guatemala City, 30-V-64, 1300 m , No. 644, leguminous vine, No. 683, shrub, S. L. Wood; Quezaltenango, 26-V-64, 16 mm, No. 622, tree branch, S. L. Wood. COSTA RICA: 2 km SE Cartago, 2-VIII-63, 1300 m , No. 98, tree branch, S. L. Wood.

Brologỳ.- This species made spiral galleries in branches $2-4 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 57 specimens. The specimens from Guatemala were slightly more slender than were those in the Costa Rican series.

## 48. Corthylus pygmaeus Wood

Fig. 227
Corthylus pygmaeus Wood, 1974, Great Basin Nat. 34:195 (Holotype, female, Finca La Lola, Limón, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from spinifer Schwarz by the smaller size and by the numerous minor features indicated below.

Female.- Length 1.5-1.8 mm, 2.0 times as long as wide; color brown.

Frons as in spinifer except more shallowly impressed (transversely flat at upper level of eyes), punctures averaging smaller, longest setae on upper third less numerous. Cirrus on antennal club shorter, its length from insertion of last hair to its apex less than length of club.

Pronotum and elytra as in spinifer except declivital sulcus not quite as deep, punctures slightly finer, impressed points largely obsolete, posterolateral margin more abruptly, less strongly elevated.

Male.-Similar to female except sexual differences as in spinifer.

Distribution.- Costa Rica.
COSTA RICA: Finca La Lola, Limón, 17-I-63, Theobroma cacao, J. L. Saunders; Pandora, Limón, 23-VllI$63,50 \mathrm{~m}$, No. I49, tree branch, S. L. Wood.

Biology.-Specimens were taken from branches $2-3 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 14 specimens.

The name pygmaeus was employed as a manuscript name for this species by Schedl, but apparently it has not been validated by him.
49. Corthylus spinifer Schwarz Fig. 228
Corthylus spinifer Schwarz, 1891, Proc. Ent. Soc. Washington 2:114 (Syntypes, females, Key West, Florida; U.S. Nat. Mus.)
Metacorthylus affinis Fonseca, 1925, Commisao de Estudio e Debellacao de Praga Cafeeira, Pub. 12:3 (Syntypes; Itatiba, São Paulo, Brazil; not located) Corthylus affinis Fonseca, 1927, Rev. Mus. Paul. 15(1):585 (Syntypes; Itatiba, Sāo Paulo, Brazil; not located; an obvious duplication of the 1925 description)

Corthylus guayanensis Eggers, 1933, Lab. d'Ent. Mus. Nat. d'Hist. Nat. Paris, Mem. 1:22 (Syntype, male; Camopi, Franz. Guayana; Paris Mus.); Wood, 1977, Great Basin Nat. 37:208. Synonymy Corthy/us tomentosus Schedl, 1940, An. Esc. Nac. Cienc. Biol., Mexico 1:350 (Syntypes, female; Tuxtepec in Oaxaca, and Ixtapa in Nayarit, Mexico; Schedl and Dampf colls.); Wood, 1976, Great Basin Nat. 36:347. Synonymy
Diagnosis.- This species is distinguished with difficulty from pygmaeus Wood by the larger size, by the more strongly impressed female frons, and by other characters mentioned below.

Female.- Length $2.0-2.4 \mathrm{~mm}$, 2.2 times as long as wide; color dark brown.

Frons rather shallowly concave from eye to eye, from epistoma to well above eyes; surface densely, finely punctured (coarser than in pygmaeus); abundant hairlike vestiture moderately long, much longer on margins (long setae twice as numerous above as in pygmaeus). Antennal club about as in sentus except suture 3 not indicated; cirrus almost twice as long as club.

Pronotum and elytral disc about as in comatus Blandford. Elytral declivity steep, broadly convex, feebly sulcate; strial punctures in obscure rows, interstrial punctures indistinguishable from those of striae, confused, punctures rather coarse, moderately deep, rather close, impressed points

Fig. 228. Corthylus spp., female outlines from dorsal and lateral aspects (frontal setae omitted): A, B, spinifer; C, D. flagellifer.
conspicuous, rather numerous; interstriae l convex, rather weakly elevated, impunctate, 2 shallowly, broadly impressed, 3 slightly elevated, rather broadly convex, armed by two or three fine tubercles on middle half; posterolateral margin acutely elevated from apex to interstriae 1 , its height equal to its thickness (higher than pygmaeus). Glabrous or with three or four short setae on interstriae 3 .

Male.- Similar to female except frons convex, reticulate, sparsely, coarsely punctured, glabrous; antennal club smaller, more symmetrical, without cirrus; anterior margin of pronotum armed by a median pair of coarse teeth.

Distribution.-Florida and Nayarit to Brazil.

USA: Florida: Brookville, Hilliard, Miami, Paradise Key, Ramrod Key, Vero Beach. MExICO: Michoacán: Patuan. Nayarit: Tepic. Veracruz: Fortín de las Flores. HONDURAS: Zamorano in Morazán. COSTA RICA: Escasí and Santa Ana in San José, PANAMA: Panama City and Taberville in the Canal Zone. VENEZUELA: States of Aragua, Barinas, Miranda.

Hosts.-Persea americana, Salix guatemalensis, Spondias mombin, S. purpurea, Theobroma cacao, etc.

Biology.- Specimens were taken from branches 2-4 cm in diameter.

Notes.- The above treatment was based on the syntypes of spinifer, on one syntype of tomentosus, on one specimen of affinis compared by Costa Lima to the type, and on 93 other specimens. Two "holotypes" and two "allotypes" of the apparent manuscript name Corthylus pseudoflagellifer Schedl are also of this species.

## 50. Corthylus flagellifer Blandford

Fig. 228

Corthylus flagellifer Blandford, 1904, Biol. Centr. Amer., Coleopt. 4(6):255 (Syntypes; Toxpan in Mexico, San Gerónimo and Pantaleon in Guatemala, and Boquete in Panama; British Mus. Nat. Hist.)
Corthylus cirrus Schedl, 1940, An. Esc. Nac. Cienc. Biol., Mexico 1:351 (Syntypes; Xochitlan, Morelos, Mexico; Schedl and Dampf colls.); Wood, 1966, Great Basin Nat. 26:22. Synonymy
Corthylus nudiusculus Schedl, 1950, Dusenia 1:156 (Holotype, female; Comitán, Chiapas, Mexico; Schedl Coll.); Wood, 1966, Great Basin Nat. 26:22. Synonymy
Diagnosis.- This species is distinguished from spinifer Schwarz by the larger size and
by characters mentioned in the above key and in the following description.

Female. - Length 2.5-3.0 mm, 2.2 times as long as wide; color dark brown to almost black.

Frons as in spinifer except punctures larger, closer, vestiture longer, more abundant, impression on lower half apparently slightly deeper. Cirrus of antennal club shorter than club.

Pronotum and elytra as in spinifer except declivity with lateral convexities conspicuously higher than suture, area of interstriae 2 more strongly, more extensively impressed.

Male.-Similar to female except sexual differences as in spinifer.

Distribution.- Nayarit and Veracruz to Guatemala.

MEXICO: Chiapas: Comitán. Morelos: Xochitlan, V11-37, Persea americana. Nayarit: 6 km W Tepic, 13-V11-65, 700 m , No. 240, tree seedling, S. L. Wood. Veracruz: Fortín de las Flores, 22-V-65, Blacklight, H. V. Weems. GUATEMALA: Pantaleon and San Geronimo, G. C. Champion; Volcán de Agua, 19-V-64, 1000 m , No. 615, Acacia, S. L. Wood; Palin, Esquintla, 19-V-64, 1000 m, No. 588, anonillo, S. L. Wood.

Biology.- Specimens were taken from branches $5-8 \mathrm{~cm}$ in diameter.

Notes. - The above treatment was based on the syntypes of flagellifer, on Schedl's female syntypes of cirrus, on the holotype of nudiusculus, and on 19 other specimens. I have seen no specimen smaller than 2.5 mm , although Blandford indicated males were as small as 2.2 mm and females 2.3 mm .

## 51. Corthylus sobrinus Wood

Corthylus sobrinus Wood, 1974, Great Basin Nat. 34:196 (Holotype, female; Turrialba, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from flagellifer Blandford by the larger size and by characters of the frons and elytral declivity mentioned below.

Female.- Length $3.0-3.4 \mathrm{~mm}, 2.1$ times as long as wide; color very dark brown.

Frons as in flagellifer except much more strongly impressed, particularly on upper half; lower fifth with a pair of rather widely separated, oval, yellow spongy areas (vestiture not interrupted by their presence); vestiture similar to flagellifer except most setae strongly flattened, less abundant at upper
margin. Antennal cirrus much more poorly developed but only slightly shorter.

Pronotum and elytra as in flagellifer except punctures on elytral disc larger but very shallow, and elytral declivity somewhat more strongly, more broadly impressed.

Male.-Similar to female except sexual differences as in spinifer.

Distribution.- Costa Rica.
COSTA RICA: Turrialba, 7-I-63, Theobroma cacao, J. L. Saunders, and $9-1 I I-64,700 \mathrm{~m}, \mathrm{No} .468 \mathrm{~B}$, fence post, S. L. Wood.

Biology.- Two specimens were taken from a new fence post 8 cm in diameter.

Notes. - The above treatment was based on the type series of 18 specimens.

## 52. Corthylus subserratus Wood

 Fig. 229Corthylus subserratus Wood, 1974, Great Basin Nat. 34:197 (Holotype, female; Volcán Poás, Heredia, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from serrulatus Eggers (from Bolivia and Peru) by the larger size and by conspicuous differences on the head and elytral declivity as indicated below.

Female. - Length $2.3-2.5 \mathrm{~mm}, 2.4$ times as long as wide; color black, with one-third to two-thirds of elytra yellowish brown (area and color intensity of pale portion variable).

Frons deeply concave from eye to eye, from epistoma to vertex, much deeper than in serrulatus; entire lower third occupied by a yellow, spongy area, upper areas dull, coarsely punctured, vestiture absent at center of concavity, increasing in size and density toward margins above eyes; margins above eyes ornamented by a dense brush of long, yellow, strongly plumose setae (as in serrulatus). Antennal club as in serrulatus, with suture 1 partly septate, 2 and 3 weakly impressed; cirrus entirely absent.

Pronotum as in serrulatus except posterior areas more strongly reticulate, weak transverse crenulations on disc much narrower. Elytra as in serrulatus except surface of disc less shining; declivity less convex, posterolateral margin ending slightly below middle of declivity, surface strongly reticulate, punctures mostly obscure, interstriae 1 slightly less strongly elevated, its summit conspicuously undulating, forming about six
rounded serrations (summit an almost uniform costa in serrulatus). Vestiture confined to declivity, of rows of erect interstrial hair on interstriae 1 and 3 and base of 2 , a few setae in lateral areas.

Male.-Similar to female except frons convex, reticulate, sparsely punctured, vestiture sparse, inconspicuous; antennal club smaller, more nearly symmetrical; anterior margin of pronotum armed by one median pair of teeth.

Distribution.- Costa Rica.
COSTA RICA: Guápiles, Limón, 22-VIII-66, $100 \mathrm{~m}, \mathrm{~S}$. L. Wood; Volcán Poás, Heredia, $2500 \mathrm{~m}, 14$-VII-63, No. 44, tree branch, 6, 14, 19-XI-63, various tree branches, S. L. Wood.

Biology.- Specimens were taken in material $6-12 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 118 specimens.

## 53. Corthylus serratus Wood

Fig. 229
Corthylus serratus Wood, 1974, Great Basin Nat. 34:197 (Holotype, female; Tapanti, Cartago, Costa Rica; Wood Coll.)
Diagnosıs.- This species is distinguished from serrulatus Eggers and subserratus Wood by the smaller size and by conspicuous differences on the head and elytral declivity as noted below.

Female.- Length 2.0-2.3 mm, 2.5 times as long as wide; color dark brown.

Frons basically shallowly concave as in serrulatus, and with oval area on median half from near epistoma to near vertex abruptly, much more strongly concave; central concavity smooth, with a few punctures and hairlike setae; lateral areas minutely, densely punctured, becoming spongy and yellowish above on median margins, this area very minutely, densely pubescent; plumose vestiture on upper margin as in subserratus. Antenna as in serrulatus except cirrus smaller, slightly shorter.

Pronotum and elytral dise as in serrulatus except punctures on elytral disc slightly larger. Elytral declivity with margins abruptly angled except rounded on basal fifth, face much more weakly convex than serrulatus, its surface shining and punctured about as in serrulatus, interstriae 1 more strongly elevated
than in serrulatus, its crest with about four to six coarse crenulations, some of them acutely pointed. Interstriae 1,3 , and 4 with very long hairlike setae.

Male.-Similar to female except sexual differences as in subserratus.

Distribution.- Costa Rica to Panama.
COSTA RICA: 16 km SE Cartago, Cartago, 24-IX-63, 1800 m, No. 204, Miconia globuliflora, S. L. Wood;

Tapantí, Cartago, 2-VII-63, 1300 m , No. 9, Miconia, also 24-IX-63, No. 271, Werklia insignis, No. 197, Siparuna nicaraguensis, No. 241, Phoebe mexicana, S. L. Wood. PANANA: Volcán Chiriquí, 11-I-64, 1800 m , No. 371, Inga, No. 399, tree branch, S. L. Wood.

Biology. - Specimens were taken from material $2-5 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 23 specimens.

Fig. 229. Corthylus spp., female outlines from dorsal and lateral aspects (frontal setae omitted): A, B, subserratus; C, D, E, serratus; F, G, concisus; H, I, proccrus.

## 54. Corthylus praeustus Schedl

Corthylus praeustus Schedl, 1950, Dusenia 1:153 (Lectotype, female; Guatemala; Schedl Coll., present designation)
Diagnosis.- This species is distinguished from petilus Wood by characters mentioned below.

Female. - Length $1.8 \mathrm{~mm}, 2.4$ times as long as wide; color light brown (not fully mature).

Frons largely obscured, apparently similar to petilus except less strongly concave, tuft of hair on vertex much more abundant and longer, lower fifth occupied by a yellow spongy area along epistoma from eye to eye, its lower margin acutely elevated particularly in lateral portion; central half not visible on type. Antennal club similar to petilus, but slightly more slender; a small cirrus extending slightly beyond apex of club.

Pronotum 1.2 times as long as wide; similar to petilus except more strongly reticulate.

Elytra about 1.4 times as long as wide (slightly spread); similar to petilus except surface more nearly reticulate, puncture more obscure. Declivity subtruncate, steep, flat to feebly convex, margin abruptly angulate to striae 1 at base, weakly elevated on about lower two-thirds; surface rather weakly reticulate, moderately shining, punctures small, shallow; interstriae 1 moderately elevated as in petilus, its crest finely serrate. Vestiture confined to declivity, of several rather short, stout setae.

Distribution.-Guatemala.
GUATEMALA: "Guatemala; Coll. Hagedorn, 1915."
Notes.- The syntypic series on which this species was based contained two or more species. I here designate as the lectotype of praeustus Schedl the female from Guatemala that Schedl regards as the type. That specimen was examined and is the only representative of the species known to me. The South American syntypes have been referred to insignis Wood. Other Central American specimens identified by Schedl as this species are of concisus Wood.

## 55. Corthylus petilus Wood

Fig. 217
Corthylus petilus Wood, 1967, Great Basin Nat. 27:56 (Holotype, female; 5 km or 3 miles W El Salto, Durango, Mexico; Wood Coll.)

Diagnosis.-Among those species having the elytral declivity truncate and margined by a complete, raised, circumdeclivital costa, this species is distinguished by the slender form and by characters on the female head as specified below.

Female.- Length $2.0-2.1 \mathrm{~mm}, 2.5$ times as long as wide; color dark brown.

Frons deeply concave from eye to eye from epistoma to vertex; lower fourth of concave area pale yellow, spongy, upper area smooth, shining, with moderately abundant fine punctures; concave area with sparse, fine, short hair, upper margin with a dense row of long plumose setae, longest setae equal in length to half distance between eyes. Antennal club strongly asymmetrical, three sutures indicated; cirrus entirely absent.

Pronotum 1.1 times as long as wide; sides on basal half almost straight and parallel, moderately converging on anterior half to very broadly rounded, unarmed anterior margin; summit indefinite, one-third pronotum length from anterior margin; anterior third asperate; posterior areas reticulate, punctures minute, rather sparse. Glabrous.

Elytra 1.7 times aslong as wide, 1.5 times as long as pronotum; sides straight and parallel on more than basal nine-tenths, very broadly rounded behind; surface shining, with obscure irregular lines, punctures small and obscure on basal fourth, larger and distinctly impressed on posterior fourth, mostly confused but strial rows indicated in some specimens. Declivity abrupt, subvertical, subacutely margined from apex to striae 1 at base; face smooth, shining, with rather coarse, confused punctures; interstriae 1 abruptly, strongly elevated, higher than wide on middle half. Glabrous.

Male. - Similar to female except frons convex, obscurely subreticulate, sparsely, rather coarsely punctured, vestiture inconspicuous; antennal club smaller, less strongly asymmetrical; anterior margin of pronotum armed by one or two pairs of median serrations.

Distribution.-Arizona to Durango.
USA: Arizona: Mt. Bigelow in Sta. Catalina Mts., 11-VI-69, 2500 m , No. 90, Quercus hypoleucoides, S. L. Wood. MEXICO: Durango: 5 km W El Salto, 7-VI-65. 2500 m , No. 41, Quercus, S. L. Wood.

Host.-Quercus hypoleucoides, Q. sp.

Biology.- Specimens were taken from dying limbs $3-6 \mathrm{~cm}$ in diameter on living trees.

Notes.- The above treatment was based on the type series of 5 specimens and on 41 other specimens.

## 56. Corthylus concisus Wood

Figs. 229-230
Corthylus compressicornis: Blandford, 1904 nec. Fabri(ius), Biol. Centr. Amer., Coleopt. 4(6):255. Misidentification
Corthylus concisus Wood, 1974, Great Basin Nat. 34:201 (Holotype, female; Tapantí, Cartago, Costa Rica; Wood Coll.)
Diagnosis.- This species is distinguished from procerus Bright by the larger size and by the characters on the head mentioned below.

Female.- Length 2.0-2.3 mm, 2.1 times as long as wide; color dark brown to almost black.

Frons flat, a weak transverse callus at level of antennal insertion; large central area smooth, glabrous, impunctate, marginal areas with fine punctures; lateral, submarginal areas with a tuft of hair from level of anten-
nal insertion to upper level of eyes, margin above upper level of eyes ornamented by a dense row of very long plumose setae. Antennal club very broad, 1.4 times wider than long, cirrus at least three times longer than club (club longer than wide and cirrus shorter than club in procerus).

Pronotum and elytral dise essentially as in petilus Wood except pronotal dise with minute, transverse crenulations, and punctures on elytral disc confused. Elytral declivity truncate, subvertical, margin abruptly, subacutely elevated on a complete circle from apex to base; face slightly convex, strongly reticulate, punctures small, confused; interstriae 1 strongly costate, as high as wide on middle half, area of 2 distinctly impressed, 3 weakly elevated on upper half and armed by about two to four small, pointed tubercles. Glabrous except for a few setae on declivital interstriae 1 and 3.

Male.-Similar to female except sexual differences as in petilus.

Distribution.- Chiapas to Panama.
MEXICO: Chiapas: 21 km N Ocozocoautla, 2-VII-69. D. E. Bright. COSTA RICA: Cartago, Tapantí, and Turrialla in Cartago; Beverley and Peralta in Limón; Volcán in Puntarenas; Escasú, San José, and Santa Ana

Fig. 230. Corthylus concisus, female antenna. Note the musually long cirms.
in San José. PANAMA: Cerro Campana, 26-VI-66, 1000 m , tree branch, S. L. Wood; 13 km S El Hato del Volcán, 7-I-64, 1000 m , tree seedling, S. L. Wood.

Hosts.- Conostegia oerstediana, Spondias purpurea, Theobroma cacao, etc.

Biology.- Specimens were taken from material $2-5 \mathrm{~cm}$ in diameter.

Notes.- The above treatment was based on the type series of 89 specimens and on 17 other specimens.

## 57. Corthylus procerus Bright Fig. 229

Corthylus procerus Bright, 1972, Canadian Ent. 104:1376 (Holotype, female; 10 km or 6 miles S Valle Nacional, Oaxaca, Mexico; Canadian Nat. Coll., 12646)
Diagnosis.- This species is distinguished from concisus Wood by the smaller size and by other characters on the female head as indicated below.

Female.- Length $1.7-1.9 \mathrm{~mm}, 2.1$ times as long as wide; color dark brown to almost black.

Frons moderately concave from eye to eye from epistoma to vertex; surface shining, rather finely, closely, uniformly punctured; vestiture essentially as in concisus. Antennal club more slender, 1.4 times longer than wide, cirrus weak, shorter than club.

Pronotum and elytra as in concisus except elytral declivity flat from interstriae 2 to lateral margin, 3 not elevated and without tubercles.

Male.-Similar to female except sexual differences as in petilus Wood.

Distribution.- Oaxaca to Panama.
MEXICO: Oaxaca: 9 km or 6 miles S Valle Nacional, 18-V-71, 700 m , D. E. Bright. COSTA RICA: Finca Gromaco, on Río Coto Brus, Puntarenas, 14-VII-63, 500 m , No. 63, woody vine, No. 77, tree seedling, S. L. Wood; Volcán, Puntarenas, 11-XII-63, 1000 m , No. 304, tree branch, S. L. Wood; 16 km SE Cartago, Cartago, 24-IX-
$63,1800 \mathrm{~m}$, No. 203, Siparuna nicaraguensis, S. L. Wood. PANAMA: Cerro Campana, 26-V1I-66, 1000 m , No. 32, tree branch, S. L. Wood; 13 km S El Hato del Volcán, 7-I-64, 1000 m , No. 371, tree seedling, S. L. Wood.

Biology.- Specimens were taken from material $2-4 \mathrm{~cm}$ in diameter.

Notes. - The above treatment was based on the holotype of procerus and on 24 other specimens.

## 58. Corthylus eichhoffi Schedl

Corthylus eichhoffi Schedl, 1933, Ent. Blätt. 29:34 (Holotype, female; Iberia, Santa Clara district, Limón, Costa Rica; Schedl Coll.)
Diagnosis.- This species is distinguished from procerus Bright by the larger size, by the less strongly elevated declivital interstriae 1 , and by striking differences on the female frons and antennal club.

Female.- Length $2.3 \mathrm{~mm}, 2.2$ times as long as wide; color dark brown.

Frons similar to procerus except surface more nearly rugose, vestiture on upper margins longer, reddish in color, more dense, extending on lateral margins to slightly below upper level of eye; epistomal area broadly, very strongly elevated, its upper surface yellowish, spongy, with low pile, longer hair on epistomal margin. Antennal club with apex acutely angulate; cirrus distinctly longer than in procerus.

Pronotum and elytral disc as in procerus. Elytral declivity similar to praeustus except circumdeclivital margin very slightly more strongly elevated, interstriae 1 less strongly elevated, and surface more flattened to irregularly subconcave.

Distribution.- Costa Rica.
COSTA RICA: Iberia, Santa Clara, 12-IV-24, an welkem laub, F. Nevermann.

Notes.- The above treatment was based on the holotype.

## INDEX

Names are indexed as follows:
CAPITALS: All names, both valid and invalid, above the generic level.
Boldface: Valid generic and subgeneric names.
Roman: Valid specific and subspecific names.
Italics: All synonyms and other names not part of the Scolytidae.
Page numbers: ltalics refer to a kev, boldface to a descriptive treatment, roman to all other references.

## GREAT BASIN NATURALIST MEMOIRS

Editor. Stephen L. Wood, Department of Zoology, Brigham Young University, Provo, Utah 84602.

Editorial Board. Kimball T. Harper, Botany, chairman; James R. Barnes, Zoology; Stanley L. Welsh, Botany; Clayton M. White, Zoology.
Ex Officio Editorial Board Members. A. Lester Allen, Dean, College of Biological and Agricultural Sciences; Ernest L. Olson, Director, Brigham Young University Press, University Editor.
The Great Basin Naturalist was founded in 1939 by Vasco M. Tanner. It has been published from one to four times a year since then by Brigham Young University, Provo, Utah. In general, only previously unpublished manuscripts of less than 100 printed pages in length and pertaining to the biological and natural history of western North America are accepted. The Great Basin Naturalist Memoirs was established in 1976 for scholarly works in biological natural history longer than can be accommodated in the parent publication. The Memoirs appears irregularly and bears no geographical restriction in subject matter. Manuscripts are subject to the approval of the editor.

Subscriptions. The annual subscription to the Great Basin Naturalist is $\$ 12$ (outside the United States $\$ 13$ ). The price for single numbers is $\$ 4$ each. All back numbers are in print and are available for sale. All matters pertaining to the purchase of subscriptions and back numbers should be directed to Brigham Young University, Life Science Museum, Provo, Utah 84602. The Great Basin Naturalist Memoirs may be purchased from the same office at the rate indicated on the inside of the back cover of either journal.

Scholarly Exchanges. Libraries or other organizations interested in obtaining either journal through a continuing exchange of scholarly publications should contact the Brigham Young University Exchange Librarian, Harold B. Lee Library, Provo, Utah 84602.

Manuscripts. All manuscripts and other copy for either the Great Basin Naturalist or the Great Basin Naturalist Memoirs should be addressed to the editor as instructed on the back cover.

Original manuscripts in English pertaining to the biological natural history of western North America and intended for publication in the Great Basin Naturalist should be directed to Brigham Young University, Stephen L. Wood, Editor, Great Basin Naturalist, Provo, Utah 84602. Those intended for the Great Basin Naturalist Memoirs should be similarly directed, but these manuscripts are not encumbered by a geographical restriction.
Manuscripts. Two copies of manuscripts are required. They should be typewritten, double spaced throughout on one side of the paper, with margins of at least one inch on all sides. Use a recent issue of either journal as a format, and the Council of Biology Editors Style Manual, Third Edition (AIBS 1972) in preparing the manuscript. An abstract, about 3 percent as long as the text, but not exceeding 200 words, written in accordance with Biological Abstracts guidelines, should precede the introductory paragraph of each article. Authors may recommend one or two reviewers for their article. All manuscripts receive a critical peer review by specialists in the subject area of the manuscript under consideration.

Manuscripts that are accepted and that are less than 100 printed pages in length will automatically be assigned to the Great Basin Naturalist. Those manuscripts larger than 100 printed pages in length will be considered for the Memoirs series.

Illustrations and Tables. All illustrations and tables should be made with a view toward having them appear within the limits of the printed page. Illustrations that form part of an article should accompany the manuscript. Illustrations should be prepared for reduction by the printer to either single-column ( $25 / 8$ inches) or double-column ( $51 / 2$ inches) width, with the length not exceeding $71 / 2$ inches.

Costs Borne by Contributor. Contributors to the Great Basin Naturalist should be prepared to donate from $\$ 10$ to $\$ 30$ per printed page towards publication of their article (in addition to reprint costs outlined in the schedule below). Authors publishing in the Great Basin Naturalist Memoirs may be expected to contribute $\$ 35$ per printed page in addition to the cost of the printed copies they purchase. No printed copies are furnished free of charge. A price list for reprints and an order form are sent with the galley proofs to contributors.

## Reprint Schedule of the Great Basin Naturalist

|  | 2 pp. | 4 pp. | 6 pp. | 8 pp. | 10 pp. | 12 pp. | Each |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | :---: |
| 100 copies | $\$ 20$ | $\$ 24$ | $\$ 28$ | $\$ 32$ | $\$ 36$ | $\$ 40$ | additional |
| 200 copies | 28 | 32 | 36 | 40 | 44 | 48 | 2 pp. |
| 300 copies | 36 | 40 | 44 | 48 | 52 | 56 | $\$ 4$ |

## Great Basin Naturalist Memoirs

No. 1 The birds of Utah. By C. L. Hayward, C. Cottam, A. M. Woodbury, H. H. Frost. \$10.
No. 2 Intermountain biogeography: a symposium. By K. T. Harper, J. L. Reveal, et al. $\$ 15$.
No. 3 The endangered species: a symposium. $\$ 6$.
No. 4 Soil-plant-animal relationships bearing on revegetation and land reclamation in Nevada deserts. $\$ 6$.
No. 5 Utah Lake monograph. $\$ 8$.
No. 6 The bark and ambrosia beetles of North and Central America (Coleoptera: Scolytidae), a taxonomic monograph. $\$ 60$.
